### **General Description**

The MAX14724 is a serial-controlled, 8:4 full-matrix analog multiplexer. The device operates from either a single wide supply or dual  $\pm 2.5V$  supplies. A wide operating range makes the device ideal for battery-powered, portable instruments. All channels guarantee break-before-make switching.

The serial control is selectable between I<sup>2</sup>C and SPI. Both modes provide individual control of each independent switch so that any combination of switches can be applied. I<sup>2</sup>C mode provides one address-select pin, allowing for addressing up to two devices on a single bus. The SPI mode includes a DO pin that can be used to daisy-chain multiple devices together with a single select signal.

The MAX14724 features bidirectional operation and can handle rail-to-rail analog signals. All control inputs are 1.6V-logic compatible. This device is available in a small 20-pin, 4mm x 4mm, TQFN and 20-bump, 2mm x 1.7mm, wafer-level package (WLP).

### **Applications**

- Medical Equipment
- Data Acquisition
- Signal Switching
- Battery-Powered Equipment

Ordering Information appears at end of data sheet.

### **Typical Application Circuit**

### **Benefits and Features**

- Flexible Architecture Enables Ease of Design and Control
  - 8:4 Matrix Switch Multiplexer
  - · Fully Programmable with Simultaneous Updates
  - · Independent Control of Each Switch
  - Serial Control
    - I<sup>2</sup>C with Address-Select Pin
    - SPI with DO for Daisy-Chain
    - 1.6V Logic Compatible
- Low Distortion Switching Improves System Performance
  - 1Ω R<sub>ON</sub> (typ) with +5V or ±2.5V Supply
  - 0.5Ω R<sub>ON</sub> Match Between Channels (typ)
  - 0.2Ω R<sub>ON</sub> Flatness Over Signal Range (typ)
  - Low Leakage Current: 5nA at +25°C (typ)
- Integrated Protection for System Reliability
  - ±30kV HBM on NO\_ and COM\_
  - ±15kV IEC 61000-4-2 Air Gap Discharge on NO\_ and COM\_
  - ±10kV IEC 61000-4-2 Contact Discharge on NO\_ and COM\_
- High-Integration Multiplexing Reduces Footprint and System Complexity
  - 20 WLP (2mm x 1.7mm)
  - 20 TQFN (4mm x 4mm)

## Serial-Controlled 8:4 Matrix Switch Multiplexer

### **Absolute Maximum Ratings**

| V+0.3V to +6V                              |
|--|
| V6V to +0.3V                               |
| V <sub>L</sub> 0.3V to +6V                 |
| V+ to V0.3V to +6V                         |
| V <sub>L</sub> to V0.3V to +9V             |
| NO_, COM_ (Note 1)(V 0.3V) to (V+ + 0.3V)  |
| SCL/SCK, SDA/DI, I2C/CS, ADD/DO0.3V to +6V |
| ADD/DO to V0.3V to +9V                     |
| Continuous Current into NO_, COM±50mA      |
| Peak Current into NO_, COM_                |
| (pulsed at 1ms, 10% duty cycle)±100mA      |

Note 1: Signals on COM\_ and NO\_ exceeding V+ or V- are clamped by internal diodes.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### **Electrical Characteristics (continued)**

(V+ = 1.6V to 5V, V- = (V+ - 5.5V) to 0V, VL = 0V to 5.5V (Notes 3, 4), TA = -40°C to +85°C, unless otherwise noted. Typical values are at V+ = 2.5V, V- = -2.5V, V<sub>L</sub> = 2.5V, T<sub>A</sub> = +25°C.) (Note 5)

| PARAMETER             | SYMBOL | CONDITIONS                      | MIN | TYP | MAX | UNITS |
|-----------------------|--------|---------------------------------|-----|-----|-----|-------|
| ESD PROTECTION        |        |                                 |     |     |     |       |
| All COM_ and NO_ pins |        | Human Body Model (HBM)          |     | ±30 |     | kV    |
| All COM_ and NO_ pins |        | IEC 61000-4-2 Air Gap Discharge |     | ±15 |     | kV    |
| All COM_ and NO_ pins |        | IEC 61000-4-2 Contact Discharge |     | ±10 |     | kV    |
| All Other Pins        |        | Human Body Model (HBM)          |     | ±2  |     | kV    |

Note 3: VL maximum operating voltage is 5.5V if V- is greater than -2.5V, otherwise the VL maximum operating voltage is (V- + 8V)

**Note 4:**  $V_L$  has to be greater than 1.6V for proper I<sup>2</sup>C and SPI communication and timing. **Note 5:** All devices are 100% production tested at  $T_A = +25^{\circ}C$ . Specifications over temperature are guaranteed by design.

Note 6: (V+ - V-) has to be greater than 2.5V for good analog performance since on-resistance varies greatly when (V+ - V-) < 2.5V (see On-Resistance in Typical Operating Characteristics).

Note 7:  $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$ .

Note 8: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges.

Note 9: Guaranteed by design.

Note 10: See the Typical Operating Characteristics for performance across operating range.

#### **Detailed Description**

The MAX14724 is a serial-controlled 8:4 full-matrix analog multiplexer. The serial control is selectable between I<sup>2</sup>C and SPI. Both modes provide individual control of each independent switch so that any combination of switches can be applied.

The device does not require balanced positive (V+) and negative (V-) supply voltage. However, the voltage difference between the two supplies (V+ - V-) should not exceed 5.5V.

#### Shutdown

The V<sub>L</sub> supply pin can be used as an active-low shutdown/ reset signal. When the voltage at V<sub>L</sub> is below the V<sub>L</sub> Shutdown Threshold Low, all switches are opened and all registers reset, including the SPI-select latch. None of the switches can be activated until the voltage at V<sub>L</sub> rises above the V<sub>L</sub> Shutdown Threshold High. The device also

resets when power is removed from V+, but it is better to use V<sub>L</sub> to signal reset or shutdown since the voltages at the analog switch pins (NO\_/COM\_) must remain between V- and V+, but are independent of V<sub>L</sub>.

#### I<sup>2</sup>C and SPI

The I2C/CS pin is used simultaneously to select between the I<sup>2</sup>C and SPI interfaces and as a chip-select pin for the SPI interface. When logic-high is applied on I2C/CS, the device enables I<sup>2</sup>C communication. To enable SPI communication, I2C/CS needs to be driven low and a serial clock should be applied on SCL/SCK. After 21 periods of clock on SCL/SCK, the device latches into SPI mode and I2C/CS operates as a purely chipselect pin. The device does not resume I<sup>2</sup>C operation if I2C/CS is driven high. To return from the latched SPI state and to the I<sup>2</sup>C state, V<sub>L</sub> or V+ must be driven low. Once V<sub>L</sub> or V+ returns high, a logic-high on I2C/CS puts the device in the I<sup>2</sup>C state again.

## Serial-Controlled 8:4 Matrix Switch Multiplexer

### I<sup>2</sup>C Serial Interface

#### **Direct Access Registers**

Direct-access registers (DIR0–DIR3) allow the user to read/write the switches eight at a time. These register addresses support autoincrementing so they can be read or written sequentially. The switches are updated once the last bit of the byte is clocked in.

#### **Shadow Registers**

Shadow registers (SHDW0–SHDW3) provide storage for switch values to allow for simultaneous updates of the switches. Unlike direct-access registers, these registers have no immediate effect until the copy command is issued. The copy command has to be written in the CMD0 and CMD1 registers. Write to the four registers with the desired state of each switch and then write the appropriate command to registers CMD0 and CMD1 to simultaneously apply the values to the switches.

#### **Set Mux Command Registers**

Set mux command registers (CMD0, CMD1) allow the user to easily select any single switch in a bank. The CMD0[7:4] bits allow the user to turn on one single switch in bank B, to open all bank B switches, to copy SHDW1 to DIR1 register, or to leave bank B as is (no change). The CMD0[3:0] bits allow the user to turn on a single switch in bank A, to open all bank A switches, to copy SHDW0 to DIR0 register, or to leave bank A as is (no change). Similarly, the CMD1[7:4] bits allow the user to turn on a single switch in bank D, to open all bank D switches, to copy SHDW3 to DIR3 register, or to leave bank D as is (no change). The CMD1[3:0] bits allow the user to turn on a single switch in bank C, to open all bank C switches, to copy SHDW2 to DIR2 register, or to leave bank C as is (no change). The values apply to the switches once both registers (CMD0 and CMD1) have been written. CMD0 and CMD1 are single 16-bit registers. Therefore, CMD0 must be programmed before CMD1.

#### **Serial Addressing**

When in I<sup>2</sup>C mode, the device operates as a slave device that sends/receives data through an I<sup>2</sup>C-compatible 2-wire interface. The interface uses a serial-data line (SDA) and a serial-clock line (SCL) to achieve bidirectional communication between master(s) and slave(s). A master (typically a microcontroller) initiates all data transfers to and from the device and generates the SCL clock that synchronizes the data transfer. The SDA line operates as both an input and an open-drain output. A pullup resistor is required on SDA. The SCL line operates only as an input. A pullup resistor is required on SCL if there are multiple masters on the 2-wire interface, or if the master in a single-master system has an open-drain SCL output. Each transmission consists of a START condition sent by a master, followed by the MAX14724 7-bit slave address plus R/W bit, a register address byte, one or more data bytes, and, finally, a STOP condition (Figure 6).

Figure 6. I<sup>2</sup>C Interface Timing Details

# Serial-Controlled 8:4 Matrix Switch Multiplexer

#### **START and STOP Conditions**

Both SCL and SDA remain high when the interface is not busy. A master signals the beginning of a transmission with a START (S) condition by transitioning SDA from high to low while SCL is high (Figure 7). When the master has finished communicating with the slave, it issues a STOP (P) condition by transitioning SDA from low to high while SCL is high. The bus is then free for another transmission.

#### **Bit Transfer**

One data bit is transferred during each clock pulse (Figure 8). The data on SDA must remain stable while SCL is high.

#### Acknowledge

An acknowledge bit (ACK) is a clocked 9th bit (Figure 9), which the recipient uses to handshake receipt of each byte of data. Thus, each byte transferred effectively requires 9

bits. The master generates the 9th clock pulse, and the recipient pulls down SDA during the acknowledge clock pulse. The SDA line is stable low during the high period of the clock pulse. When the master is transmitting to the MAX14724, it generates the acknowledge bit because the device is the recipient. When the device is transmitting to the master, the master generates the acknowledge bit because the master is the recipient. If the device did not pull SDA low, a not acknowledge (NACK) is indicated.

#### **Slave Address**

The device features a 7-bit slave address, configured by the ADD/DO input. To select the slave address, connect ADD/DO to GND or V<sub>L</sub>, as indicated in <u>Table 3</u>. The device has two possible addresses, allowing up to two MAX14724 devices to share the same interface bus. The bit following a 7-bit slave address is the R/W bit, which is low for a write command and high for a read command.

Figure 9. Acknowledge

### Table 3. Slave Address Configuration

| LOGIC INPUT |    | I <sup>2</sup> C SLAVE ADDRESS |    |    |    |    |             |     |      |       |  |
|-------------|----|--------------------------------|----|----|----|----|-------------|-----|------|-------|--|
| ADD/DO      | A6 | A5                             | A4 | A3 | A2 | A1 | A0<br>(ADD) | R/W | READ | WRITE |  |
| 0           | 1  | 1                              | 1  | 0  | 1  | 0  | 0           | 1/0 | 0xE9 | 0xE8  |  |
| 1           | 1  | 1                              | 1  | 0  | 1  | 0  | 1           | 1/0 | 0xEB | 0xEA  |  |

## Serial-Controlled 8:4 Matrix Switch Multiplexer

#### **Bus Reset**

The device resets the bus with the I<sup>2</sup>C START condition for reads. When the  $R/\overline{W}$  bit is set to 1, the device transmits data to the master. Therefore, the master is reading from the device.

#### Format for Writing

A write to the MAX14724 comprises the transmission of the slave address with the  $R/\overline{W}$  bit set to zero, followed by at least 1 byte of information. The first byte of information is the register address or command byte. The register address determines which register of the

device is to be written by the next byte, if received. If a STOP (P) condition is detected after the register address is received, the device takes no further action beyond storing the register address. Any bytes received after the register address are data bytes. The first data byte goes into the register selected by the register address, with subsequent data bytes going into subsequent registers (Figure 10). If multiple data bytes are transmitted before a STOP condition, these bytes are stored in subsequent registers because the register addresses autoincrement (Figure 11).

Figure 10. Format for I<sup>2</sup>C Write

Figure 11. Format for Writing to Multiple Registers

### Serial-Controlled 8:4 Matrix Switch Multiplexer

#### **Format for Reading**

The device is read using the internally stored register address as an address pointer, the same way the stored register address is used as an address pointer for a write. The pointer autoincrements after each data byte is read using the same rules for a write. Therefore, a read is initiated by first configuring the register address by performing a write (Figure 11). The master can now read consecutive bytes from the device, with the first data byte being read from the register address pointed to by the previously written register address (Figure 12). Once the master sounds a NACK, the MAX14724 stops sending valid data.

#### **SPI Interface**

In SPI mode, the device operates a shift register designed to work with common serial interfaces. The bits are shifted through so that a large serial chain can be made to minimize pins needed for a system with multiple devices (see Figure 21). This shift register is also designed to be compatible with common microcontroller SPI-type interfaces. The switches in the MAX14724 are all transitioned simultaneously. To update the switches in SPI mode, the user must shift in a bit with the desired state of each switch according to the data format listed in Table 4. The switches are updated at the rising edge of CS, with the last 32 bits of data shifted in only if the number of bits clocked in is greater than or equal to the number of switches (32). The DO pin is the serial output of the shift register.

Figure 12. Format for Reads (Repeated START)

Figure 13. Format for Reading Multiple Registers

### Serial-Controlled 8:4 Matrix Switch Multiplexer

This outputs the data loaded into DI, delayed by 32 clocks, and is intended for creating a serial daisy-chain to minimize the number of select lines required by the SPI interface. The first 32 bits out of DO after the falling edge of  $\overline{CS}$  are the contents of the shift register prior to  $\overline{CS}$  falling, followed by the data being clocked into DI. The bits in the shift register are all zero when power is applied or after shutdown is released.

Note that the data in the shift register may not be the same as the state of the switches. The DO pin is intended for daisy-chain applications and not for switch readback. Note for (V+ - V-) less than 2.7V or V<sub>L</sub> less than 2.7V, the DO propagation delay can limit the maximum SPI operating frequency. See Figures 14 and 15 for SPI timing diagrams. The voltage level driven out by the DO buffer is set by the voltage applied to V<sub>L</sub>. This allows the voltage to be independent of the supply voltage.

Figure 14. SPI Timing Details

Figure 15. SPI Timing Diagram

## Serial-Controlled 8:4 Matrix Switch Multiplexer

### **Applications Information**

#### **Serial Bus Configurations**

The MAX14724 was designed to support a wide variety of multiplexing applications. Multiple devices can be used in a system to expand the number of ports being multiplexed. With the address-select pin provided in I<sup>2</sup>C mode, two devices can be attached to the same I<sup>2</sup>C bus simultaneously. There are also several options for addressing multiple devices when using the SPI interface. Using only three pins on the microcontroller, as many devices as desired can be loaded by connecting all  $\overline{CS}$  and SCK pins in parallel and chaining the DO pin from one device to the DI pin on the next. It is also acceptable to provide a separate  $\overline{CS}$  pin for each device so they can be individually addressed and loaded. Alternatively, a separate data line can be used for each device to reduce the time required to load all the devices. Some of the options and tradeoffs are listed in Table 5. as well as example application diagrams in the typical application circuit.

Extended ESD

ESD-protection structures are incorporated on all pins to protect against electrostatic discharges up to  $\pm 2kV$ 

(Human Body Model) encountered during handling and assembly. NO\_ and COM\_ are further protected against ESD up to  $\pm 30$ kV (Human Body Model),  $\pm 15$ kV (Air Gap Discharge method described in IEC 61000-4-2), and  $\pm 10$ kV (Contact Discharge method described in IEC 61000-4-2) without damage.

The ESD structures withstand high ESD both in normal operation and when the device is powered down. After an ESD event, the device continues to function without latchup.

#### **ESD Test Condition**

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

#### **Human Body Model**

Figure 16 shows the Human Body Model. Figure 17 shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest that is then discharged into the device through a  $1.5k\Omega$  resistor.

### Table 5. Benefits and Limitations of Different Serial-Bus Configurations

| SERIAL BUS                         | PINS | BENEFITS  | LIMITATIONS   |  |  |
|------------------------------------|------|---|---|--|--|
| I <sup>2</sup> C (Figure 20)       | 2    | Fewest pins   | Maximum two devices per bus, slow protoco<br>no simultaneous updates across all devices   |  |  |
| SPI Daisy-Chain<br>(Figure 21)     | 3    | Faster than I <sup>2</sup> C with only one additional pin, simultaneous updates across all devices in chain | n x 32 clocks required to load all devices  |  |  |
| SPI Separate CS<br>(Figure 22) n+2 |      | Common SPI implementation, quick for single device updates  | n x 32 clocks required to load all devices,<br>requires an additional pin per device, no<br>simultaneous updates across all devices |  |  |
| SPI Separate<br>Data (Figure 23)   | n+2  | Fastest loading for multiple devices,<br>simultaneous updates across all devices                            | Requires an additional pin per device, may not be supported by the SPI controller   |  |  |

## Serial-Controlled 8:4 Matrix Switch Multiplexer

#### IEC 61000-4-2

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment. However, it does not specifically refer to integrated circuits. The major difference between tests done using the Human Body Model and IEC 61000-4-2 is higher peak current in IEC 61000-

Figure 18. IEC 61000-4-2 ESD Test Model

4-2 because series resistance is lower in the IEC 61000-4-2 model. Hence, the ESD withstand voltage measured to IEC 61000-4-2 is generally lower than that measured using the Human Body Model. Figure 18 shows the IEC 61000-4-2 model, and Figure 19 shows the current waveform for the IEC 61000-4-2 ESD Contact Discharge test.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию.

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России, а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научноисследовательскими институтами России.

С нами вы становитесь еще успешнее!
