## DESCRIPTION:

The FCT164245T 16-bit 3.3V-to-5V translator is built using advanced dual metal CMOS technology. This high-speed, low-power transceiver is designed to interface between a 3.3V bus and a 5V bus in a mixed 3.3V/5V supply environment. This enables system designers to interface TTL compatible 3.3V components with 5V components. The direction and output enable controls operate these devices as either two independent 8-bit transceivers or one 16-bit transceiver. The A port interfaces with the 3.3V bus; the B port interfaces with the 5V bus. The direction control (xDIR) pin controls the direction of data flow. The output enable pin (x $\overline{OE}$ ) overrides the direction control and disables both ports. These control signals can be driven from either 3.3V or 5V devices.

The FCT164245T is ideally suited for driving high-capacitance loads and low-impedance backplanes. The output buffers are designed with power off disable capability to allow "hot insertion" of boards when used as backplane drivers. They also allow interface between a mixed supply system and external 5 volt peripherals.

## POWER SUPPLY SEQUENCING

In the 74FCT164245T, the condition of  $V_{CC1} \geq (V_{CC2} - 0.5V)$  must be maintained at all times. For the range of  $V_{CC1} = (V_{CC2} - 0.5V)$  to  $V_{CC1} = (V_{CC2} + 0.9V)$ , both the A and B ports will remain in a High-Impedance state.
