**MEMORY CONSTITUTION**

Address 000<sub>16</sub> to 11F<sub>16</sub> are assigned to the display RAM, address 120<sub>16</sub> to 128<sub>16</sub> are assigned to the display control registers. The internal circuit is reset and all display control registers (address 120<sub>16</sub> to 128<sub>16</sub>) are set to "0" when the AC pin level is "L". And then RAM is erased.

Memory constitution is shown in Figure 1.

**SCREEN CONSTITUTION**

The screen lines and rows are determined from each address of the display RAM. The screen constitution is shown in Figure 2.

**REGISTER SUPPLEMENTARY DESCRIPTION**

(1) Setting external clock input mode (by use of EXCK0 (120<sub>16</sub>) and EXCK1 (123<sub>16</sub>))

Two modes given below are available for the external clock signal input. (the settings (EXCK1, EXCK0) = (0, 1), (1, 0) are forbidden.)

(a) When (EXCK1, EXCK0) = (0, 0), Fosc = 20 to 30 MHz

Input from the TCK pin a constant-period continuous external clock that synchronizes with the horizontal synchronization signal. And input from HOR pin a constant-period continuous horizontal synchronous signal.

Never stop inputting the clock while displaying.

Do not have to set a display frequency because the clock just as it is entered from outside is used as the display clock.

(b) When (EXCK1, EXCK0) = (1, 1), Fosc = 20 to 80 MHz

Input from the TCK pin a constant-period continuous external clock that synchronizes with the horizontal synchronization signal.

Never stop inputting the clock while displaying.

Be sure to set a display frequency because the internal clock made to synchronize with the clock input from outside is used as the display clock (see the next page).

(Example for input)

Horizontal synchronous signal

External clock

SCREEN CHARACTER and PATTERN DISPLAY CONTROLLERS

(2) Setting display frequencies

Set a display frequency by setting a frequency value for the horizontal synchronization signal by use of DIV10 to DIV0 (120<sub>16</sub>).

Set display frequency area in conformity with the frequency of the external clock signal.

Set display frequency area by use of DIVS0, DIVS1 (120<sub>16</sub>), RSEL0 (121<sub>16</sub>), and RSEL1 (122<sub>16</sub>). Frequency area are as follows.

RSEL1	RSEL0	DIVS1	DIVS0	Display frequency area
0	1	0	0	70.0 to 80.0
0	0	0	0	63.0 to 70.0
1	0	0	1	56.6 to 63.0
0	1	0	1	46.6 to 56.6
0	0	0	1	45.0 to 46.6
1	0	1	0	42.5 to 45.0
0	1	1	0	35.0 to 42.5
0	0	1	0	31.5 to 35.0
1	0	1	1	28.3 to 31.5
0	1	1	1	23.3 to 28.3
0	0	1	1	20.0 to 23.3

Cautions in setting a display frequency

To change the external clock frequency or the horizontal synchronization frequency, follow the steps in sequence given below.

- (a) Display OFF (DSPON = 0)
- (b) Set the display frequency (Use DIV10 to DIV0 (120<sub>16</sub>), DIVS0, DIVS1 (120<sub>16</sub>), RSEL0 (121<sub>16</sub>), and RSEL1 (122<sub>16</sub>).
- (c) 20-ms waiting time with the horizontal synchronization signal and the external clock signal being input
- (d) Display ON (DSPON = 1)

Fig. 6 Example of data setting by the serial input function (2)

**SERIAL DATA INPUT TIMING**

- (1) Serial data should be input with the LSB first.
- (2) The address consists of 16 bits.
- (3) The data consists of 16 bits.
- (4) The 16 bits in the SCK after the  $\overline{CS}$  signal has fallen are the address, and for succeeding input data, the address is incremented every 16 bits. Therefore, it is not necessary to input the address from the second data.

Fig. 7 Serial input timing

**CHARACTER FONT**

Images are composed on a 12 × 18 dot matrix, and characters can be linked vertically and horizontally with other characters to allow the display the continuous symbols.

Fig. 8 Example for displaying a continuous pattern after combining characters in the horizontal or vertical direction

Character code FF16 is fixed as a blank without background. Therefore, cannot register a character font in this code.

**NOTE FOR SUPPLYING POWER**

Timing of power supplying to  $\overline{AC}$  pin

The internal circuit of M35046-XXXSP/FP is reset when the level of the auto clear input pin  $\overline{AC}$  is "L". This pin is hysteresis input with the pull-up resistor. The timing about power supplying of  $\overline{AC}$  pin is shown in Figure 11.

Timing of power supplying to  $V_{DD1}$  and  $V_{DD2}$ .  
Supply power to  $V_{DD1}$  and  $V_{DD2}$  at the same time.

Fig. 11 Timing of power supplying to  $\overline{AC}$  pin

After supplying the power ( $V_{DD}$  and  $V_{SS}$ ) to M35046-XXXSP/FP and the supply voltage becomes more than  $0.8 \times V_{DD}$ , it needs to keep  $V_{IL}$  time;  $t_w$  of the  $\overline{AC}$  pin for more than 1ms.

Start inputting from microcomputer after  $\overline{AC}$  pin supply voltage becomes more than  $0.8 \times V_{DD}$  and keeping 200ms wait time.

**PRECAUTION FOR USE**

Notes on noise and latch-up

In order to avoid noise and latch-up, connect a bypass capacitor ( $\approx 0.1\mu F$ ) directly between the  $V_{DD1}$  pin and  $V_{SS}$  pin, and the  $V_{DD2}$  pin and  $V_{SS}$  pin using a heavy wire.
