An ON Semiconductor Company

LV8746V — Bi-CMOS LSI PWM Constant-Current Control Stepping Motor Driver

Overview

The LV8746V is a stepping motor driver corresponding to the W1-2 aspect excitation drive that the selection of CLK-IN input and a parallel input is possible. It is ideally suited for driving brushed DC motors and stepping motors used in office equipment and amusement applications.

Features

- PWM current control stepping motor driver incorporated.
- BiCDMOS process IC
- Low on resistance (upper side : 0.84Ω ; lower side : 0.7Ω ; total of upper and lower : 1.54Ω ; Ta = 25°C, I_O = 1A)
- Excitation mode can be set to 2-phase, 1-2 phase Full torque, 1-2 phase, or W1-2 phase
- CLK-IN input and a parallel input can be selected.
- Motor current selectable in four steps
- Output short-circuit protection circuit (selectable from latch-type or auto-reset-type) incorporated
- Unusual condition warning output pins
- No control power supply required

Specifications

Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	V _M max		38	V
Output peak current	I _O peak	tw ≤ 10ms, duty 20%	1.2	A
Output current	I _O max		1	A
Logic input voltage	V _{IN}		-0.3 to +6	V
EMO input voltage	V _{emo}		-0.3 to +6	V

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Substrate Specifications (Substrate recommended for operation of LV8746V)

- Size : 90mm × 90mm × 1.6mm (two-layer substrate [2S0P])
- Material : Glass epoxy
- Copper wiring density : L1 = 85% / L2 = 90%

L1 : Copper wiring pattern diagram

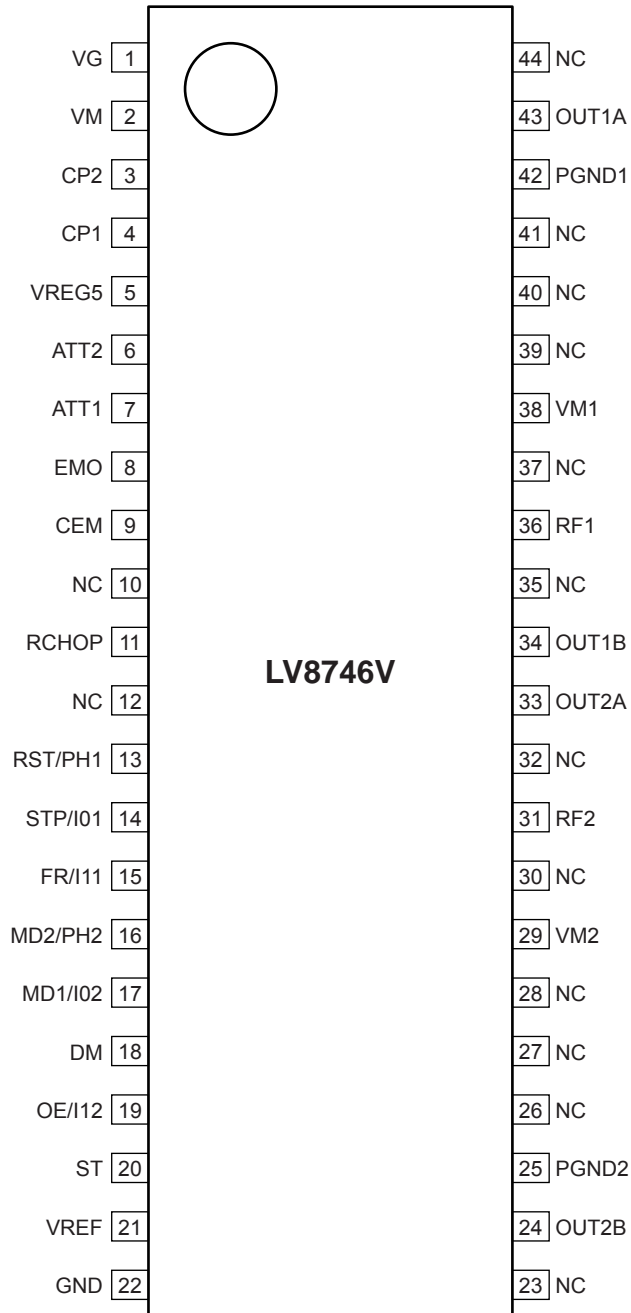

L2 : Copper wiring pattern diagram

Cautions

- 1) The data for the case with the Exposed Die-Pad substrate mounted shows the values when 90% or more of the Exposed Die-Pad is wet.
- 2) For the set design, employ the derating design with sufficient margin.
Stresses to be derated include the voltage, current, junction temperature, power loss, and mechanical stresses such as vibration, impact, and tension.
Accordingly, the design must ensure these stresses to be as low or small as possible.
The guideline for ordinary derating is shown below :
 - (1)Maximum value 80% or less for the voltage rating
 - (2)Maximum value 80% or less for the current rating
 - (3)Maximum value 80% or less for the temperature rating
- 3) After the set design, be sure to verify the design with the actual product.
Confirm the solder joint state and verify also the reliability of solder joint for the Exposed Die-Pad, etc.
Any void or deterioration, if observed in the solder joint of these parts, causes deteriorated thermal conduction, possibly resulting in thermal destruction of IC.

Description of operation

Input Pin Function

(1) Chip enable function

This IC is switched between standby and operating mode by setting the ST pin. In standby mode, the IC is set to power-save mode and all logic is reset. In addition, the internal regulator circuit and charge pump circuit do not operate in standby mode.

ST	Mode	Internal regulator	Charge pump
Low or Open	Standby mode	Standby	Standby
High	Operating mode	Operating	Operating

(2) Input control method switching pin function

The IC input control method is switched by setting the DM pin. The CLK-IN input control and the parallel input control can be selected by setting the DM pin.

DM	Input control method
Low or Open	CLK-IN input control
High	Parallel input control

CLK-IN input control (DM = Low or Open)

(1) STEP pin function

Input		Operating mode
ST	STP	
Low	*	Standby mode
High		Excitation step proceeds
High		Excitation step is kept

(2) Excitation mode setting function

MD1	MD2	Excitation mode	Initial position	
			Channel 1	Channel 2
Low	Low	2 phase excitation	100%	-100%
High	Low	1-2 phase excitation (Full torque)	100%	0%
Low	High	1-2 phase excitation	100%	0%
High	High	W1-2 phase excitation	100%	0%

This is the initial position of each excitation mode in the initial state after power-on and when the counter is reset.

(3) Setting constant-current control reference voltage

ATT1	ATT2	Current setting reference voltage
Low	Low	$V_{REF} / 5 \times 100\%$
High	Low	$V_{REF} / 5 \times 67\%$
Low	High	$V_{REF} / 5 \times 50\%$
High	High	$V_{REF} / 5 \times 33\%$

The voltage input to the VREF pin can be switched to four-step settings depending on the statuses of the two inputs, ATT1 and ATT2. This is effective for reducing power consumption when motor holding current is supplied.

Set current value calculation method.

The reference voltage is set by the voltage applied to the VREF pin and the two inputs ATT1 and ATT2. The output current (output current at a constant-current drive current ratio of 100%) can be set from this reference voltage and the RF resistance value.

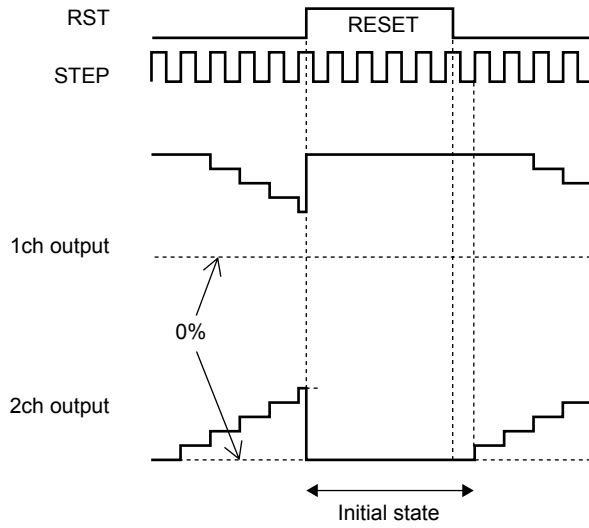

$$I_{OUT} = (V_{REF}/5) \times (\text{current attenuation ratio}) / R_F \text{ resistance}$$

Example : At VREF of 1.5V, a reference voltage setting of 100% [(ATT1, ATT2) = (L, L)] and an RF resistance of 0.5Ω, the output current is set as shown below.

$$I_{OUT} = 1.5V/5 \times 100\%/0.5\Omega = 0.6A$$

(4) Reset function

RST	Operating mode
Low	Normal operation
High	Reset state

When the RST pin is set to High, the excitation position of the output is forcibly set to the initial state. When RST is then set to Low, the excitation position is advanced by the next STEP input.

(5) Output enable function

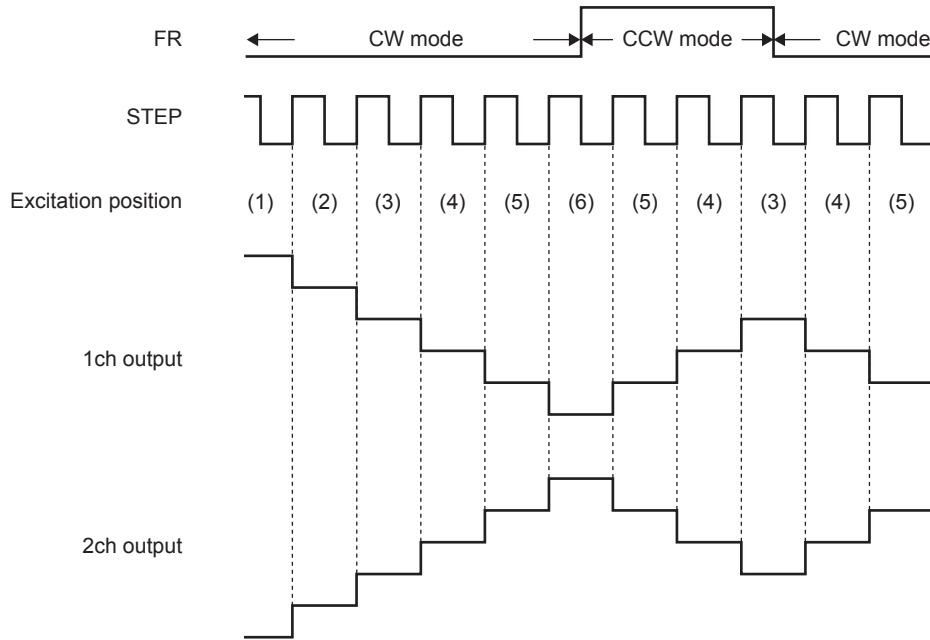

OE	Operating mode
Low	Output ON
High	Output OFF

When the OE pin is set High, the output is forced OFF and goes to high impedance. However, the internal logic circuits are operating, so the excitation position proceeds when the STEP signal is input. Therefore, when OE is returned to Low, the output level conforms to the excitation position proceeded by the STEP input.

(6) Forward/reverse switching function

FR	Operating mode
Low	CW
High	CCW

The internal D/A converter proceeds by one bit at the rising edge of the input STEP pulse.
 In addition, CW and CCW mode are switched by setting the FR pin.
 In CW mode, the channel 2 current phase is delayed by 90° relative to the channel 1 current.
 In CCW mode, the channel 2 current phase is advanced by 90° relative to the channel 1 current.

(7) Chopping frequency setting

For constant-current control, chopping operation is made with the frequency determined by the external resistor.
 The chopping frequency to be set with the resistance connected to the RCHOP pin (pin 11) is as shown below.

LV8746V

(8) Output current vector locus (one step is normalized to 90 degrees)

Setting current ration in each excitation mode

STEP	W1-2 phase (%)		1-2 phase (%)		1-2 phase full torque (%)		2-phase (%)	
	Channel 1	Channel 2	Channel 1	Channel 2	Channel 1	Channel 2	Channel 1	Channel 2
00	0	100	0	100	0	100		
01	33.3	100						
02	66.7	66.7	66.7	66.7	100	100	100	100
03	100	33.3						
04	100	0	100	0	100	0

LV8746V

1-2 phase excitation Full torque (CW mode)

W1-2 phase excitation (CW mode)

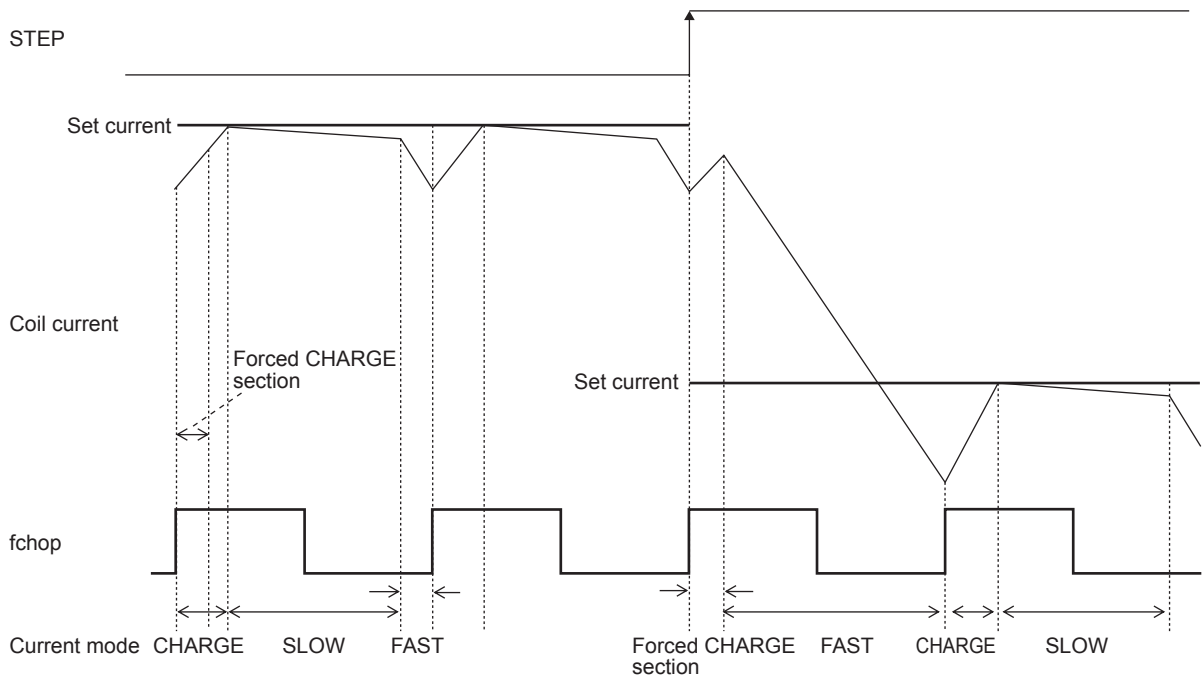

(10) Current control operation specification

(Sine wave increasing direction)

(Sine wave decreasing direction)

In each current mode, the operation sequence is as described below :

- At rise of chopping frequency, the CHARGE mode begins. (The section in which the CHARGE mode is forced regardless of the magnitude of the coil current (ICOIL) and set current (IREF) exists for 1/16 of one chopping cycle.)
- The coil current (ICOIL) and set current (IREF) are compared in this forced CHARGE section.

When $(ICOIL < IREF)$ state exists in the forced CHARGE section ;

CHARGE mode up to $ICOIL \geq IREF$, then followed by changeover to the SLOW DECAy mode, and finally by the FAST DECAy mode for the 1/16 portion of one chopping cycle.

When $(ICOIL < IREF)$ state does not exist in the forced CHARGE section;

The FAST DECAy mode begins. The coil current is attenuated in the FAST DECAy mode till one cycle of chopping is over.

Above operations are repeated. Normally, the SLOW (+FAST) DECAy mode continues in the sine wave increasing direction, then entering the FAST DECAy mode till the current is attenuated to the set level and followed by the SLOW DECAy mode.

Parallel input control (DM-High)

(1) Parallel input control logic

I01(02)	I11(12)	Output current (I _O)
Low	Low	0
High	Low	$I_O = ((V_{REF}/5)/R_F) \times 1/3$
Low	High	$I_O = ((V_{REF}/5)/R_F) \times 2/3$
High	High	$I_O = (V_{REF}/5)/R_F$

PH1(2)	current direction
Low	OUTB → OUTA
High	OUTA → OUTB

(2) Setting constant-current control reference voltage

The constant current control standard voltage setting function is the same specification as the CLK-IN input control.

(3) Current control function

The current control function is the same use as the CLK-IN input control.

LV8746V

(4) Typical current waveform in each excitation mode when stepping motor parallel input control
 2-phase excitation (CW mode)

1-2 phase excitation full torque (CW mode)

LV8746V

1-2 phase excitation (CW mode)

W1-2 phase excitation (CW mode)

Output short-circuit protection function

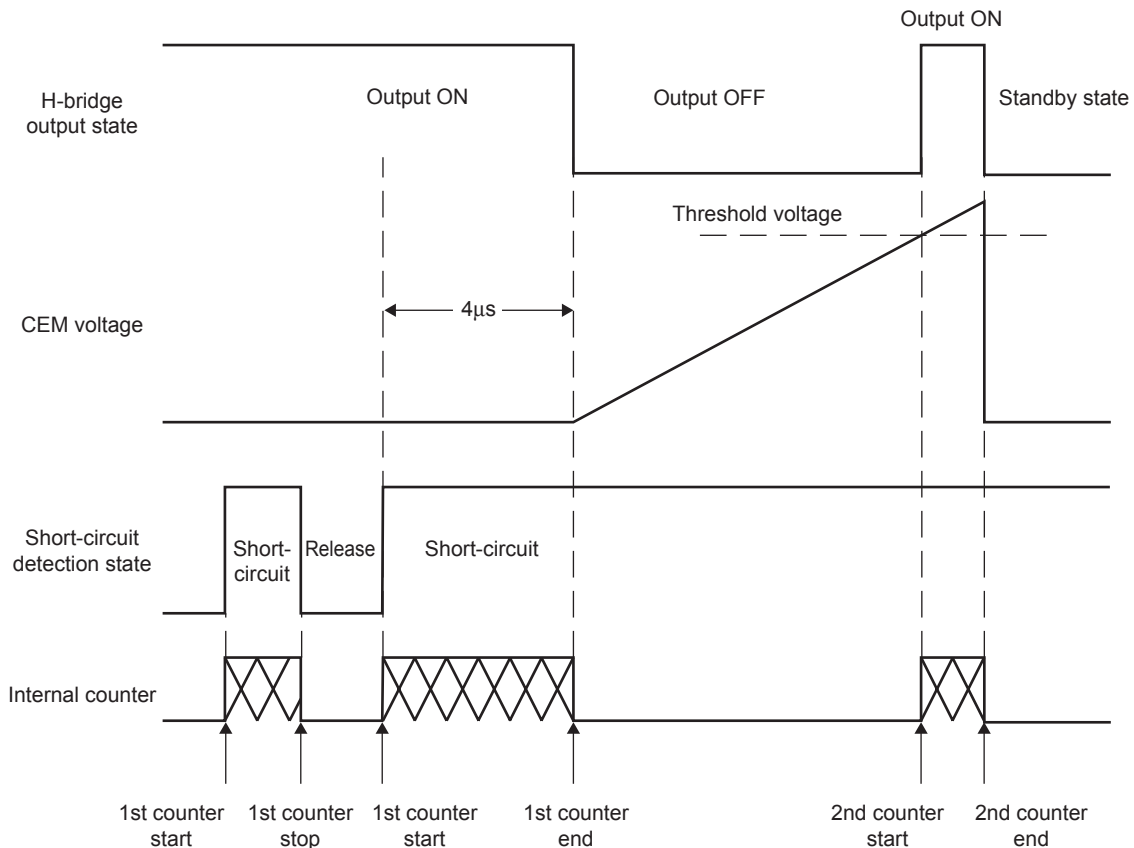

This IC incorporates an output short-circuit protection circuit that, when the output has been shorted by an event such as shorting to power or shorting to ground, to prevent the thing that IC destroys, the output short-circuit protection circuit that turns off the output is built into.

(1) Protection function operation(Latch type)

The detection of the output short-circuited state by the IC causes the output short-circuit protection circuit to be activated.

When the short-circuited state continues for the period of time set using the internal timer (approximately 4μs), the output in which the short-circuiting has been detected is first set to OFF. After this, the output is set to ON again as soon as the timer latch time (Tcem) described later has been exceeded, and if the short-circuited state is still detected, all the outputs of the channel concerned are switched to the standby mode, and this state is held.

This state is released by setting ST to low.

(2) Unusual condition warning output pins (EMO)

IC is provided with the EMO pin which notifies the CPU of an unusual condition if the protection circuit operates by detecting an unusual condition of the IC. This pin is of the open-drain output type and when an unusual condition is detected, the EMO output is placed in the ON (EMO = Low) state.

Furthermore, the EMO pin is placed in the ON state when one of the following conditions occurs.

1. Shorting-to-power, shorting-to-ground, or shorting-to-load occurs at the output pin and the output short-circuit protection circuit is activated.
2. The IC junction temperature rises and the thermal protection circuit is activated.

(3) Timer latch time (Tcem)

The time taken for the output to be set to OFF when the output has been short-circuited can be set using capacitor Ccem, connected between the CEM pin and GND. The value of capacitor Ccem is determined by the formula given below.

Timer latch : Tcem $Tcem \approx Ccem \times Vtcm / Icem$ [sec]
 Vtcm : Comparator threshold voltage, typ 1V
 Icem : CEM pin charge current, typ 10μA

Charge Pump Circuit

When the ST pin is set High, the charge pump circuit operates and the VG pin voltage is boosted from the VM voltage to the VM + VREG5 voltage. If the VG pin voltage is not boosted sufficiently, the output cannot be controlled, so be sure to provide a wait time of tONG or more after setting the ST pin High before starting to drive the motor.

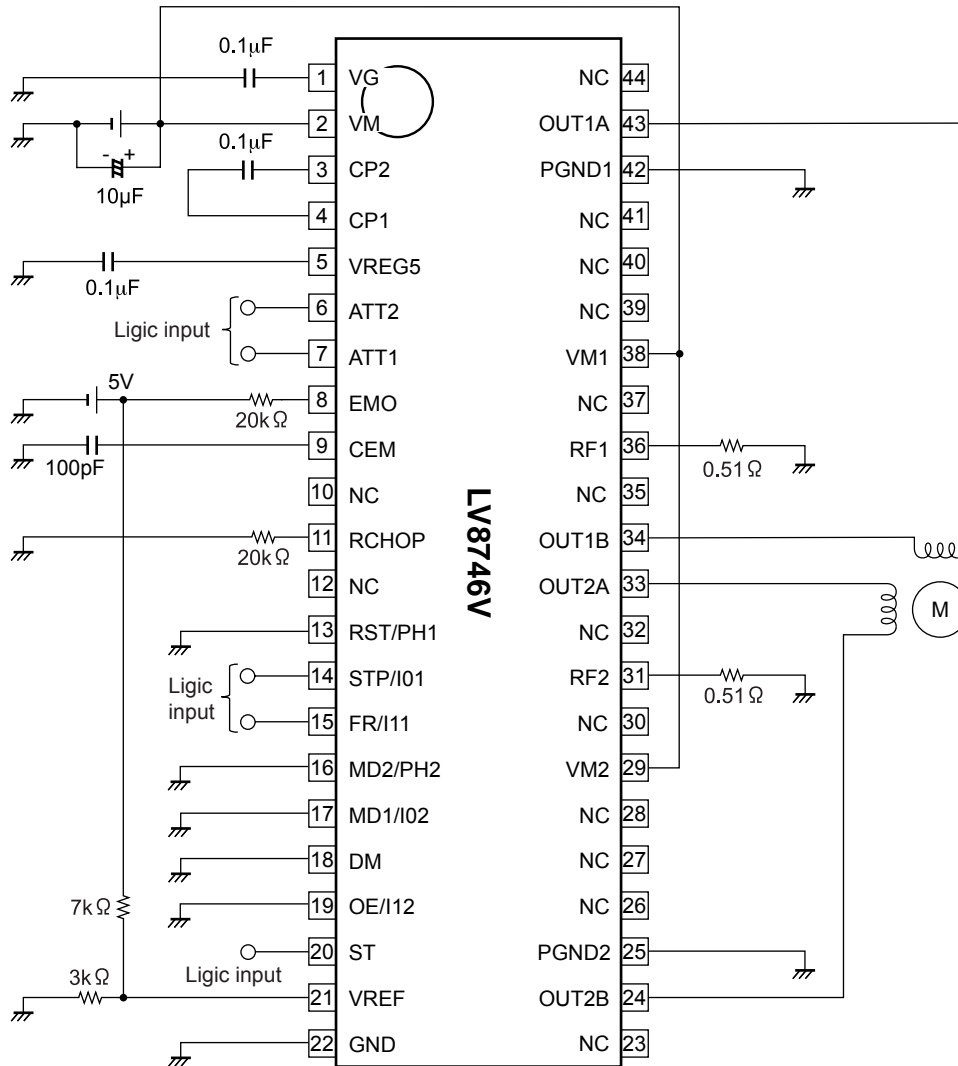

VG Pin Voltage Schematic View

LV8746V

Application Circuit Example

- Clock Inn mode application circuit

The setting conditions for the above circuit diagram example are as follows :

- 2-phase excitation (MD1/I02 = Low, MD2/PH2 = Low)
- Reset function fixed to normal operation (RST = Low)
- Chopping frequency : 62.5kHz (RCHOP = 20kΩ)

ATT1	ATT2	Current setting reference voltage
Low	Low	VREF/5×100%
High	Low	VREF/5×67%
Low	High	VREF/5×50%
High	High	VREF/5×33%

The set current value is as follows :

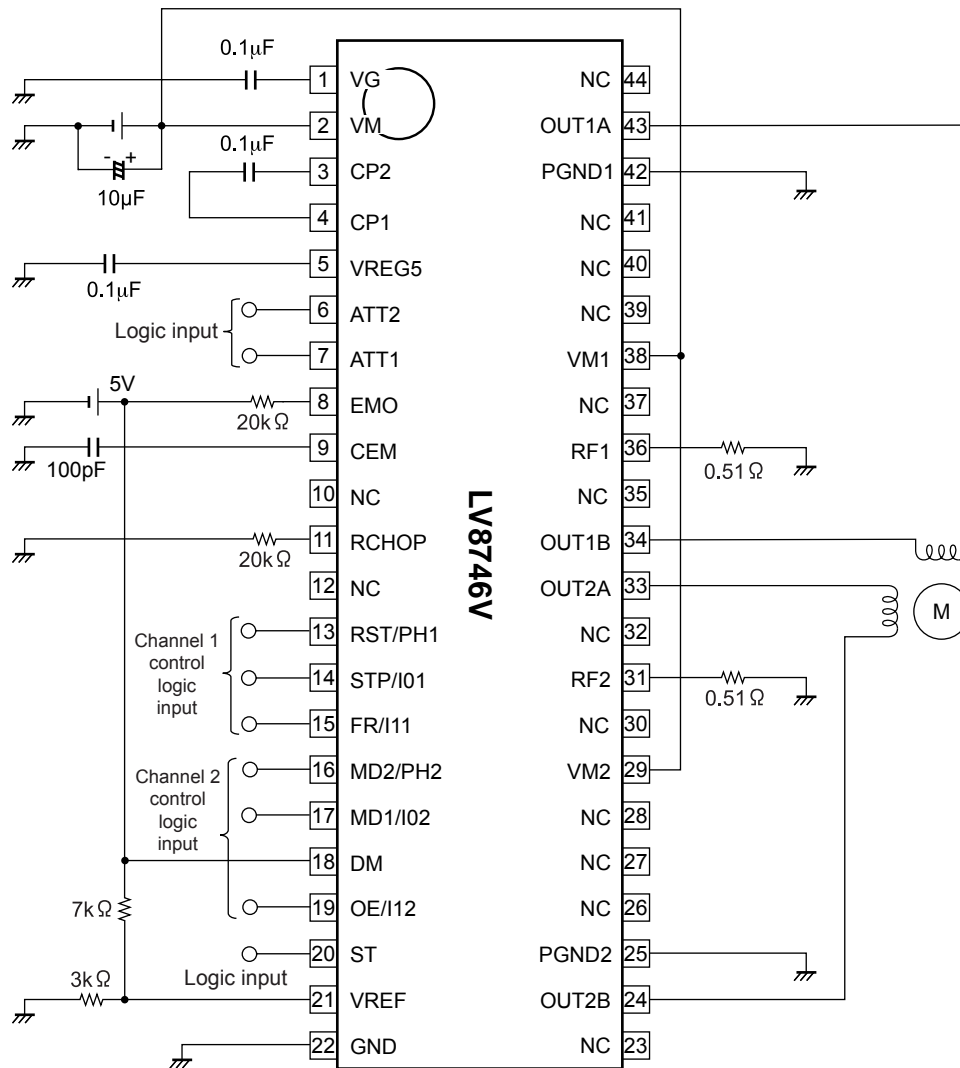

$$I_{OUT} = (VREF/5 \times \text{Voltage setting ratio}) / RF$$

Example) When ATT=Low,ATT2=Low (VREF = 1.5V,RF=0.51Ω)

$$I_{OUT} = (1.5V / 5 \times 1) / 0.51\Omega = 0.6A$$

LV8746V

- DC motor driver circuit (DM = High, and the current limit function is in use.)

The setting conditions for the above circuit diagram example are as follows :

- Chopping frequency : 62.5kHz (RCHOP = 20kΩ)

I01(02)	I11(12)	Output current (I _O)
Low	Low	0
High	Low	$I_O = ((VREF/5) / RF) \times 1/3$
Low	High	$I_O = ((VREF/5) / RF) \times 2/3$
High	High	$I_O = (VREF/5) / RF$

Example) When ATT=Low,ATT2=Low,I01(02)=High,I11(12)=High (VREF = 1.5V,RF=0.51Ω)

$$I_{OUT} = (1.5V / 5 \times 1) / 0.51\Omega = 0.6A$$

PH1(2)	Electrical current direction
Low	OUTB → OUTA
High	OUTA → OUTB

Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
