MAXIM

12-Bit Low-Power, 2-Wire, Serial Voltage-Output DAC

MAX5812

General Description

The MAX5812 is a single, 12-bit voltage-output, digital-to-analog converter (DAC) with an I²C™-compatible 2-wire interface that operates at clock rates up to 400kHz. The device operates from a single 2.7V to 5.5V supply and draws only 100µA at V_{DD} = 3.6V. A low-power power-down mode decreases current consumption to less than 1µA. The MAX5812 features three software-selectable power-down output impedances: 100kΩ, 1kΩ, and high impedance. Other features include an internal precision Rail-to-Rail® output buffer and a power-on reset circuit that powers up the DAC in the 100kΩ power-down mode.

The MAX5812 features a double-buffered I²C-compatible serial interface that allows multiple devices to share a single bus. All logic inputs are CMOS-logic compatible and buffered with Schmitt triggers, allowing direct interfacing to optocoupled and transformer-isolated interfaces. The MAX5812 minimizes digital noise feedthrough by disconnecting the clock (SCL) signal from the rest of the device when an address mismatch is detected.

The MAX5812 is specified over the extended temperature range of -40°C to +85°C and is available in a space-saving 6-pin SOT23 package. Refer to the MAX5811 for the 10-bit version.

Applications

Digital Gain and Offset Adjustments

Programmable Voltage and Current Sources

Programmable Attenuation

VCO/Varactor Diode Control

Low-Cost Instrumentation

Battery-Operated Equipment
Features

♦ **Ultra-Low Supply Current**
    100µA at V_{DD} = 3.6V
    130µA at V_{DD} = 5.5V

♦ **300nA Low-Power Power-Down Mode**

♦ **Single 2.7V to 5.5V Supply Voltage**

♦ **Fast 400kHz I²C-Compatible 2-Wire Serial Interface**

♦ **Schmitt-Trigger Inputs for Direct Interfacing to Optocouplers**

♦ **Rail-to-Rail Output Buffer Amplifier**

♦ **Three Software-Selectable Power-Down Output Impedances**
    100kΩ, 1kΩ, and High Impedance

♦ **Read-Back Mode for Bus and Data Checking**

♦ **Power-On Reset to Zero**

♦ **Miniature 6-Pin SOT23 Package**

Detailed Description

The MAX5812 is a 12-bit, voltage-output DAC with an I2C/SMBus-compatible 2-wire interface. The device consists of a serial interface, power-down circuitry, input and DAC registers, a 12-bit resistor string DAC, unity-gain output buffer, and output resistor network. The serial interface decodes the address and control bits, routing the data to either the input or DAC register. Data can be directly written to the DAC register immediately updating the device output, or can be written to the input register without changing the DAC output. Both registers retain data as long as the device is powered.

DAC Operation

The MAX5812 uses a segmented resistor string DAC architecture, which saves power in the overall system and guarantees output monotonicity. The MAX5812's input coding is straight binary with the output voltage given by the following equation:

$$V_{OUT} = \frac{V_{REF} \times (D)}{2^N}$$

where N = 12(bits), and D = the decimal value of the input code (0 to 4095).

Output Buffer

The MAX5812 analog output is buffered by a precision unity-gain follower that slews 0.5V/µs. The buffer output swings rail-to-rail and is capable of driving 5kΩ in parallel with 200pF. The output settles to ±0.5LSB within 4µs.

Power-On Reset

The MAX5812 features an internal power-on-reset (POR) circuit that initializes the device upon power-up. The DAC registers are set to zero-scale and the device is powered down with the output buffer disabled and the output pulled to GND through the 100kΩ termination resistor. Following power-up, a wake-up command must be initiated before conversions are performed.

Power-Down Modes

The MAX5812 has three software-controlled, low-power, power-down modes. All three modes disable the output buffer and disconnect the DAC resistor string from V$_{DD}$, reducing supply current draw to 300nA. In power-down mode 0, the device output is high impedance. In power-down mode 1, the device output is internally pulled to GND by a 1kΩ termination resistor. In power-down mode 2, the device output is internally pulled to GND by a 100kΩ termination resistor. Table 1 shows the power-down mode command words.

Upon wake-up, the DAC output is restored to its previous value. Data is retained in the input and DAC registers during power-down mode.

Digital Interface

The MAX5812 features an I2C/SMBus-compatible 2-wire interface consisting of a serial data line (SDA)

Table 1. Power-Down Command Bits

| POWER-DOWN COMMAND BITS		MODE/FUNCTION

MAXIM _____ 7

MAX5812

Figure 1. Two-Wire Serial Interface Timing Diagram

and a serial clock line (SCL). The MAX5812 is SMBus compatible within the range of V_{DD} = 2.7V to 3.6V. SDA and SCL facilitate bidirectional communication between the MAX5812 and the master at rates up to 400kHz. Figure 1 shows the 2-wire interface timing diagram. The MAX5812 is a transmit/receive slave-only device, relying upon a master to generate a clock signal. The master, typically a microcontroller, initiates data transfer on the bus and generates SCL to permit that transfer.

A master device communicates to the MAX5812 by transmitting the proper address followed by command and/or data words. Each transmit sequence is framed by a START (S) or REPEATED START (S_r) condition and a STOP (P) condition. Each word transmitted over the bus is 8 bits long and is always followed by an acknowledge clock pulse.

The MAX5812 SDA and SCL drivers are open-drain outputs, requiring a pullup resistor (500Ω or greater) to generate a logic high voltage (see the *Typical Operating Circuit*). Series resistors R_S are optional. These series resistors protect the input stages of the MAX5812 from high-voltage spikes on the bus lines and minimize crosstalk and undershoot of the bus signals.

Bit Transfer
One data bit is transferred during each SCL clock cycle. The data on SDA must remain stable during the high period of the SCL clock pulse. Changes in SDA while the SCL is high are control signals (see the *START and STOP Conditions* section). SDA and SCL idle high when the I2C bus is not busy.

START and STOP Conditions
When the serial interface is inactive, SDA and SCL idle high. A master device initiates communication by issuing a START condition. A START condition is a high-to-

Figure 2. START/STOP Conditions

Figure 3. Early STOP condition

MAXIM

low transition on SDA with SCL high. A STOP condition is a low-to-high transition on SDA while SCL is high (Figure 2). A START condition from the master signals the beginning of a transmission to the MAX5812. The master terminates transmission by issuing a not acknowledge followed by a STOP condition (see the *Acknowledge Bit* section). The STOP condition frees the bus. If a repeated START condition (S_r) is generated instead of a STOP condition, the bus remains active. When a STOP condition or incorrect address is detected, the MAX5812 internally disconnects SCL from the serial interface until the next START condition, minimizing digital noise and feedthrough.

Early STOP Conditions

The MAX5812 recognizes a STOP condition at any point during transmission except when a STOP condition occurs in the same high pulse as a START condition (Figure 3). This condition is not a legal I2C format, at least one clock pulse must separate any START and STOP conditions.

Repeated START Conditions

A repeated start (S_r) condition might indicate a change of data direction on the bus. Such a change occurs when a command word is required to initiate a read operation. S_r also can be used when the bus master is writing to several I2C devices and does not want to relinquish control of the bus. The MAX5812 serial interface supports continuous write operations with or without an S_r condition separating them. Continuous read operations require S_r conditions because of the change in direction of data flow.

Acknowledge Bit (ACK)

The acknowledge bit (ACK) is the ninth bit attached to any 8-bit data word. ACK is always generated by the receiving device. The MAX5812 generates an ACK when receiving an address or data by pulling SDA low during the ninth clock period. When transmitting data, the MAX5812 waits for the receiving device to generate an ACK. Monitoring ACK allows detection of unsuccessful data transfers. An unsuccessful data transfer occurs if a receiving device is busy or if a system fault has occurred. In the event of an unsuccessful data transfer, the bus master should reattempt communication at a later time.

Slave Address

A bus master initiates communication with a slave device by issuing a START condition followed by the 7-bit slave address (Figure 4). When idle, the MAX5812 waits for a START condition followed by its slave address. The serial interface compares each address

Table 2. MAX5812 I2C Slave Addresses

PART	V_{ADD}	DEVICE ADDRESS ($A_6...A_0$)

| C3	C2	C1	C0	D11	D10	D9	D8

Figure 5. Command Byte Definition

value bit-by-bit, allowing the interface to power-down immediately when an incorrect address is detected. The LSB of the address word is the Read/$\overline{Write}$ (R/$\overline{W}$) bit. R/$\overline{W}$ indicates whether the master is writing to or reading from the MAX5812 (R/$\overline{W}$ = 0 selects the write condition, R/$\overline{W}$ = 1 selects the read condition). After receiving the proper address, the MAX5812 issues an ACK by pulling SDA low for one clock cycle.

The MAX5812 has eight factory/user-programmed addresses (Table 2). Address bits A6 through A1 are preset; A0 is controlled by ADD. Connecting ADD to GND sets A0 = 0. Connecting ADD to V_{DD} sets A0 = 1. This feature allows up to eight MAX5812s to share a bus.

Write Data Format

In write mode (R/$\overline{W}$ = 0), data that follows the address byte controls the MAX5812 (Figure 5). Bits C3–C0 configure the MAX5812 (Table 3). Bits D11–D0 are DAC data. Input and DAC registers update on the falling edge of SCL during the acknowledge bit. Should the write cycle be prematurely aborted, data will not be updated and the write cycle must be repeated. Figure 6 shows two example write data sequences.

Figure 7. Example Read Word Data Sequence

Figure 8. Powering the MAX5812 from An External Reference

Read Data Format

In read mode (R/W̄ = 1), the MAX5812 writes the contents of the DAC register to the bus. The direction of data flow reverses after the address acknowledge by the MAX5812. The device transmits the first byte of data, waits for the master to acknowledge, and then transmits the second byte. Figure 7 shows an example-read data sequence.

I^2C Compatibility

The MAX5812 is compatible with existing I^2C systems. SCL and SDA are high-impedance inputs; SDA has an open drain that pulls the data line low during the ninth clock pulse. The *Typical Operating Circuit* shows a typical I^2C application. The communication protocol supports standard I^2C 8-bit communications. The general call address is ignored. The MAX5812 address is com-patible only with the 7-bit I^2C addressing protocol. Ten-bit address formats are not supported.

Digital Feedthrough Suppression

When the MAX5812 detects an address mismatch, the serial interface disconnects the SCL signal from the core circuitry. This minimizes digital feedthrough caused by the SCL signal on a static output. The serial interface reconnects the SCL signal when a valid START condition is detected.

Applications Information

Powering the Device From an External Reference

The MAX5812 uses the V_{DD} as the DAC voltage reference. Any power-supply noise is directly coupled to the device output. The circuit in Figure 8 uses a precision voltage reference to power the MAX5812, isolating the device from any power-supply noise. Powering the MAX5812 in such a manner greatly improves overall performance, especially in noisy systems. The MAX6030 (3V, 75ppm/°C) or the MAX6050 (5V, 75ppm/°C) precision voltage references are ideal choices because of the low power requirements of the MAX5812.

Digital Inputs and Interface Logic

The MAX5812 2-wire digital interface is I^2C and SMBus-compatible. The two digital inputs (SCL and SDA) load

12-Bit Low-Power, 2-Wire, Serial Voltage-Output DAC

MAX5812

Functional Diagram
the digital input serially into the DAC. Schmitt-trigger buffered inputs allow slow transition interfaces such as optocouplers to interface directly to the device. The digital inputs are compatible with CMOS logic levels.

Power-Supply Bypassing and Ground Management

Careful PC board layout is important for optimal system performance. Keep analog and digital signals separate to reduce noise injection and digital feedthrough. Use a ground plane to ensure that the ground return from GND to the power supply ground is short and low impedance. Bypass V_{DD} with a 0.1µF capacitor to ground as close to the device as possible.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
