

# 33 W auxiliary SMPS for refrigerator using ICE5QR1070AZ

REF\_5QR1070AZ\_33W1

## About this document

### Scope and purpose

This document is a reference design for a 33 W auxiliary SMPS for a refrigerator with the latest fifth-generation Infineon QR CoolSET™ ICE5QR1070AZ. The power supply is designed with a universal input compatible with most geographic regions and dual isolated outputs (+12 V/2.66 A and +5 V/0.2 A) as typically employed in most home appliances.

Highlights of the auxiliary power supply for a refrigerator:

- High efficiency under light-load conditions to meet ENERGY STAR requirements
- Simplified circuitry with good integration of power and protection features
- Single-layer PCB design for compatibility with wave-soldering process and low-cost manufacturing
- Auto-restart protection scheme to minimize interruption to enhance end-user experience

### Intended audience

This document is intended for power supply design or application engineers, etc. who want to design auxiliary power supplies for refrigerators that are efficient under light-load conditions, reliable and easy to design.

### System introduction

## 1 System introduction

With the growing household trend for internet-connected devices, the new generation of home appliances such as refrigerators are equipped with advanced features which often include communication capability, such as wireless communication, touchscreen display and sensors. These will transform a static product into an interactive and intelligent home appliance, capable of adapting to the smart-home theme. To support this trend, Infineon has introduced the latest fifth-generation QR CoolSET™ to address this need in an efficient and cost-effective manner.

An auxiliary SMPS is needed to power the various modules and sensors, which typically operate from a stable DC voltage source. The Infineon CoolSET™ (as shown in Figure 1) forms the heart of the system, providing the necessary protection and AC/DC conversion from the mains to multiple regulated DC voltages to power the various blocks.

**Figure 1 Simplified refrigerator system block diagram**

Table 1 lists the system requirements for a refrigerator, and the corresponding Infineon solution is shown in the right-hand column.

**Table 1 System requirements and Infineon solutions**

	System requirement for a refrigerator	Infineon solution – ICE5QR1070AZ
1	High efficiency under light-load conditions to meet ENERGY STAR requirements	New QR control and active burst mode (ABM)
2	Simplified circuitry with good integration of power and protection features	Embedded 700 V MOSFET and controller in DIP-7 package
3	Single-layer PCB design for compatibility with wave-soldering process and low-cost manufacturing	Input OVP and brown-in/brown-out features
4	Auto-restart protection scheme to minimize interruption to enhance end-user experience	All abnormal protections are in auto restart

### System introduction

#### **1.1 High efficiency under light-load conditions to meet ENERGY STAR requirements**

During typical refrigerator operation, the power requirement fluctuates according to various use cases. However, in most cases, the refrigerator will reside in an idle state in which the loading towards the auxiliary power supply is low. It is crucial that the auxiliary power supply operates as efficiently as possible, because it will be in this particular state for a prolonged period. Under light-load conditions, losses incurred with the power switch are usually dominated by the switching operation. The choice of switching scheme and frequency play a crucial role in ensuring high conversion efficiency.

In this reference design, ICE5QR1070AZ was primarily chosen due to its QR switching scheme. Compared with a traditional flyback switching scheme, the CoolSET™ will attempt to turn on its integrated HV MOSFET in the valley of the resonant period, thereby minimizing switching losses. Additionally, the fifth-generation QR series has the highest detection rate in the industry, of up to 10 valleys, thereby lowering the switching frequency further along with a reduction in load. Therefore an efficiency of more than 80% is achievable under 25% loading conditions.

#### **1.2 Simplified circuitry with good integration of power and protection features**

To relieve the designer of the complexity of PCB layout and circuit design, CoolSET™ is a highly integrated device with both a controller and an high voltage (HV) MOSFET integrated in a single, space-saving DIP-7 package. These certainly help the designer to reduce component count as well as simplifying the layout into a single-layer PCB design for ease of manufacturing, using the traditional, cost-effective wave-soldering process.

#### **1.3 Single-layer PCB design for compatibility with the wave-soldering process and low-cost manufacturing**

To counter abnormal line input conditions, CoolSET™ has integrated line input over voltage (OV) as well as brown-in/brown-out protection to increase the robustness of the auxiliary power. In the event of such faults, the controller within the CoolSET™ will halt the switching operation of the integrated HV MOSFET, thereby preventing permanent damage. These features allow the designer to reduce the complexity of introducing additional external circuitry and yield a saving of as many as 15 components.

#### **1.4 Auto-restart protection scheme to minimize interruption to enhance end-user experience**

For a refrigerator it would be annoying to both the end-user and the manufacturer if the system were to halt and latch after protection. To minimize interruption, the CoolSET™ implements auto-restart mode for all abnormal protections.

## 2 Reference design board

This document provides complete design details including specifications, schematics, Bill of Materials (BOM), and PCB layout and transformer design and construction information. This information includes performance results pertaining to line/load regulation, efficiency, transient load, thermal conditions, conducted EMI scans, etc.

Figure 2 REF\_5QR1070AZ\_33W1

### Power supply specifications

## 3 Power supply specifications

The table below represents the minimum acceptance performance of the design. Actual performance is listed in the measurements section.

**Table 2 Specifications of REF\_5QR1070AZ\_33W1**

Description	Symbol	Min.	Typ.	Max.	Units	Comments
<b>Input</b>						
Voltage	$V_{IN}$	85	–	300	V AC	2 wires (no P.E.)
Frequency	$f_{LINE}$	47	50/60	64	Hz

Common Mode (CM)		4	–	–	kV	
Ambient temperature	$T_{amb}$	0	–	50	°C	Free convection, sea level
Form factor		117 × 66 × 30			mm <sup>3</sup>	L × W × H

- Minimum load condition (min. load) : 5 V at 6 mA and 12 V 0 A
- Typical load condition (typ. load) : 5 V at 60 mA and 12 V at 1 A
- Maximum load condition (max. load) : 5 V at 200 mA and 12 V at 2.66 A

### 4 Circuit diagram

Figure 3 Schematic of REF\_5QR1070AZ\_33W1

## 5 Circuit description

In this section, the reference design circuit for refrigerator auxiliary power will be briefly described by the different functional blocks. For details of the design procedure and component selection for the flyback circuitry please refer to the IC design guide [2] and calculation tool [3].

### 5.1 EMI filtering and line rectification

The input of the refrigerator auxiliary power unit is taken from the AC power grid which is in the range of 85 V AC ~ 300 V AC. The fuse F1 is right at the entrance to protect the system in case of excess current entering the system circuit due to any fault. Following is the varistor VAR, which is connected across L and N to absorb the line surge transient. Inductors L11, C11 and C14 form a  $\pi$  filter to attenuate the DM and CM conducted EMI noise. C11 and C14 must be X-capacitor grade. The values of L11, C11 and C14 are verified and confirmed during the conducted EMI measurement. There are optional spark-gap devices SA1 and SA2 to absorb further higher surge level transient if required by the system. Resistors R10 and R10A are used to discharge the X-capacitor when the AC is off in order to fulfill the IEC61010-1 and UL1950 safety requirement. The bridge rectifier BR1 rectifies the AC input into DC voltage, filtered by the bulk capacitor, C13.

The above is not applicable if the PFC circuit is used as shown in Figure 1.

### 5.2 Flyback converter power stage

The flyback converter power stage consists of C13, transformer TR1, a primary HV MOSFET (integrated into ICE5QR1070AZ), secondary rectification diodes D21 and D22, secondary output capacitors and filtering (C22, C23, L21 and C24 for  $V_{OUT1}$  and C28, L22 and C210 for  $V_{OUT2}$ ).

When the integrated CoolMOS™ turns on, some energy is stored in the transformer. When it turns off, the stored energy would release to the output capacitors and the output loading through the output diode D21 and D22.

Sandwich winding structure for the transformer TR1 is used to reduce the leakage inductance, and so the loss in the clamper circuit is reduced. TR1 has two output windings; one for the  $V_{OUT1}$  (12 V) and the other for the  $V_{OUT2}$  (5 V). The output rectification of  $V_{OUT1}$  is provided by the diode D21 through filtering of C22, C23, L21 and C24. The output rectification of  $V_{OUT2}$  is provided by diode D22 through filtering of C28, L22 and C210. All the secondary capacitors must be the low-ESR type, which can effectively reduce the switching ripple. Together with the Y-capacitor C12 across the primary and secondary side, the EMI noise can be further reduced to comply with CISPR 22 specifications.

### 5.3 Control of Flyback converter through fifth-generation QR CoolSET™ ICE5QR1070AZ

#### 5.3.1 Integrated HV power MOSFET

The ICE5QR1070AZ CoolSET™ is a seven-pin device in a DIP-7 package. It has been integrated with the new QR PWM controller and all necessary features and protections, and most importantly the 700 V power MOSFET, Infineon Superjunction (SJ) CoolMOS™. Hence, the schematic is much simplified and the circuit design is made much easier.

### Circuit description

#### 5.3.2 Current sensing (CS)

The ICE5QR1070AZ is a current mode controller. The peak current is controlled cycle-by-cycle through the CS resistors R14 and R14A in the CS pin (pin 3) and so transformer saturation can be avoided and the system is more robust and reliable.

#### 5.3.3 Feedback (FB) and compensation network

Resistors R25 and R25A are used to sense the  $V_{OUT1}$  and  $V_{OUT2}$  through the shared current regulation method and FB to the reference pin (pin 1) of error amplifier IC21 with reference to the voltage at resistor R26 and R26A. A type 2 compensation network C25, C26 and R24 is connected between the output pin (pin 3) and the reference pin (pin 2) of the IC21 to stabilize the system. The IC21 further connects to pin 2 of optocoupler, and IC12 with a series resistor R22 to convert the control signal to the primary side through the connection of pin 4 of the IC12 to ICE5QR1070AZ FB pin (pin 1) and complete the control loop. Both the optocoupler IC12 and the error amplifier IC21 are biased by  $V_{OUT1}$ ; IC12 is a direct connection while IC21 is through an R23 resistor.

The FB pin of ICE5QR1070AZ is a multi-function pin which is used to select the entry burst power level (there are two levels available) through R17 and also the burst-on/burst-off sense input during ABM.

#### 5.4 Unique features of the fifth-generation QR CoolSET™ ICE5QR1070AZ to support the requirements of refrigerator auxiliary power

##### 5.4.1 Fast self-start-up and sustaining of $V_{CC}$

The IC start-up uses the cascode structure integrated into the package to charge up the  $V_{CC}$  capacitor during the start-up stage [2]. The ZCD pin (pin 4) is a multi-function pin and it serves as the start-up pin with the connection of pull-up resistors R16, R16A and R16B, which has the other end connecting to the bus voltage during the start-up phase. The device is implemented with two steps of charging current: the smaller current 0.2 mA ( $V_{VCC\_typ} = 0\text{ V} \sim 1.1\text{ V}$ ) and the larger current 3.2 mA ( $V_{VCC\_typ} = 1.1\text{ V} \sim 16\text{ V}$ ). The start-up time consists of the addition of those two charging times. With  $V_{CC}$  capacitor C16 at 33  $\mu\text{F}$ , the start-up time is shortened to around 0.3 s.

After start-up, the IC  $V_{CC}$  supply is sustained by the auxiliary winding of transformer TR1, which needs to support the  $V_{CC}$  to be above under voltage lockout (UVLO) voltage (10 V typ.) through the rectifier circuit D12, R12, R12A and C16.

##### 5.4.2 QR switching with valley sensing

ICE5QR1070AZ is a QR flyback controller which always turns on at the lowest valley point of the drain voltage. The IC senses the valley point through the ZCD pin (pin 4), which monitors auxiliary winding voltage by R15, D13 and C19 to the ZCD pin (pin 4) together with the internal resistor  $R_{ZCD}$ . The IC detects the valley crossing signal. When the ZCD voltage drops below 100 mV (typ.), the CoolMOS™ is allowed to switch-on. With QR switching, the lowest switching losses can be achieved for good efficiency.

##### 5.4.3 System robustness and reliability through protection features

###### 5.4.3.1 Input voltage monitoring and protection

To avoid system damage due to the high AC input transient, refrigerator auxiliary power requires the input line OV protection to stop the flyback converter switching whenever the  $V_{BUS}$  voltage exceeds the operating range. The IC has a  $V_{IN}$  pin (pin 2), which can sense  $V_{BUS}$  voltage through voltage dividers R18, R18A, R18B and R19. When the  $V_{IN}$  pin exceeds the protection threshold 2.9 V (typ.), the IC stops switching. With the same  $V_{IN}$  sensing,

### Circuit description

ICE5QR1070AZ also implements input under voltage (UV) protection (brown-in/brown-out) to prevent the over current (OC) stress of the power stage components when the input voltage is too low.

#### 5.4.3.2 Other protections with auto restart

Besides input OV and UV protection, ICE5QR1070AZ has more comprehensive protection features to protect the system, such as  $V_{CC}$  OV,  $V_{CC}$  UV, over-load, output short-circuit, open-loop protection, output OV, over-temperature, CS short-to-GND,  $V_{CC}$  short-to-GND, etc.

### 5.5 Clamper circuit

A clamper network, D11, C15 and R11, is used to reduce the switching spikes for the drain pin, which are generated from the leakage inductance of the transformer TR1. This is a dissipative circuit and the selection of the R11 needs to be fine-tuned.

### 5.6 PCB design tips

For a good PCB design layout, there are several points to note.

- The power loop needs to be as small as possible (see Figure 4). There are three power loops in the reference design; one from the primary side and two from the secondary side. For the primary side, it starts from the bulk capacitor (C13) positive to the bulk capacitor negative. The power loop components include C13, the main primary transformer winding (pin 6 and pin 4 of TR1), the drain pin and CS pin of the CoolSET™ IC11 and CS resistors R14 and R14A. For the secondary side, the 12 V output starts from the secondary transformer windings (pin 7 and 9 of TR1), output diode D21 and output capacitors C22 and C23, while the 5 V output starts from the secondary transformer windings (pins 10 and 12 of TR1), output diode D22 and output capacitor C28.
- Star ground concept should be used to avoid unexpected HF noise coupling to affect the proper control. The ground of the small-signal components, e.g. C111, C17, C18, C19 and R19, and emitter of optocoupler (pin 3 of IC12) etc. should connect directly to the IC ground (pin 8 of IC11). Then it connects to the negative terminal of the C13 capacitor directly.

Figure 4 PCB layout tips

### Circuit description

- Adding a certain amount of drain PCB copper area or changing to a 2 oz. copper PCB can increase the power capability margin of the CoolSET™.
- Adding the spark-gap (PCB saw-tooth, 0.5 mm separation) pattern under the input CM choke L11 can increase the system input line surge capability.
- Separating the HV components and LV components e.g. clamper circuit (D11, R11 and C15) at the lower part of the PCB (refer to Figure 4) and the other LV components at the top part of the PCB can reduce the spark-over chance of the high energy surge during ESD or a lightning surge test.

## 5.7 EMI reduction tips

EMI compliance is always a challenge for the power supply designer. There are several critical points to consider in order to achieve satisfactory EMI performance.

- Good transformer winding coupling is very important. Without this it would lead to high leakage inductance and incur a lot of switching spike and HF noise. The most effective method is to adopt sandwich winding (refer to Figure 8) where the secondary winding is in the middle of the winding and covered by the primary winding on the bottom and top layer. Shielding the transformer can reduce the HF noise. The outermost shield wrapped around the transformer cores with copper foil can help to reduce leakage flux and reduce the noise coupling to nearby components. The inner shield (copper foil or copper wire winding) between the transformer windings can help to reduce the parasitic capacitance and reduce the HF noise coupling. Both shields need to tie to the negative of C13 to achieve the best performance, but note that the inner shield approach would result in more energy loss.
- Short power loop design in PCB (as described in section 5.6) and terminate to the low ESR capacitor such as C13 for primary side loop and C22, C23 and C28 for the secondary side loops. It can help to reduce the switching ripple which comes out to the input terminals  $V_{IN}$ . In addition, adding a low ESR ceramic capacitor in parallel to the C13/C22/C23/C28 can help to further reduce the switching ripple.
- Sufficient input LC (L11, C14 and C11) filter design is important to pass the EMI requirement. As a note that the most effective capacitor is C11 which has the best filtering capability to the switching ripple.
- The Y-capacitor C12 has a function to return the HF noise to the source (negative of C13) and reduce the overall HF noise going out to the input terminals. The larger capacitance is more effective. However, larger value would introduce larger leakage current and may fail the safety requirement.

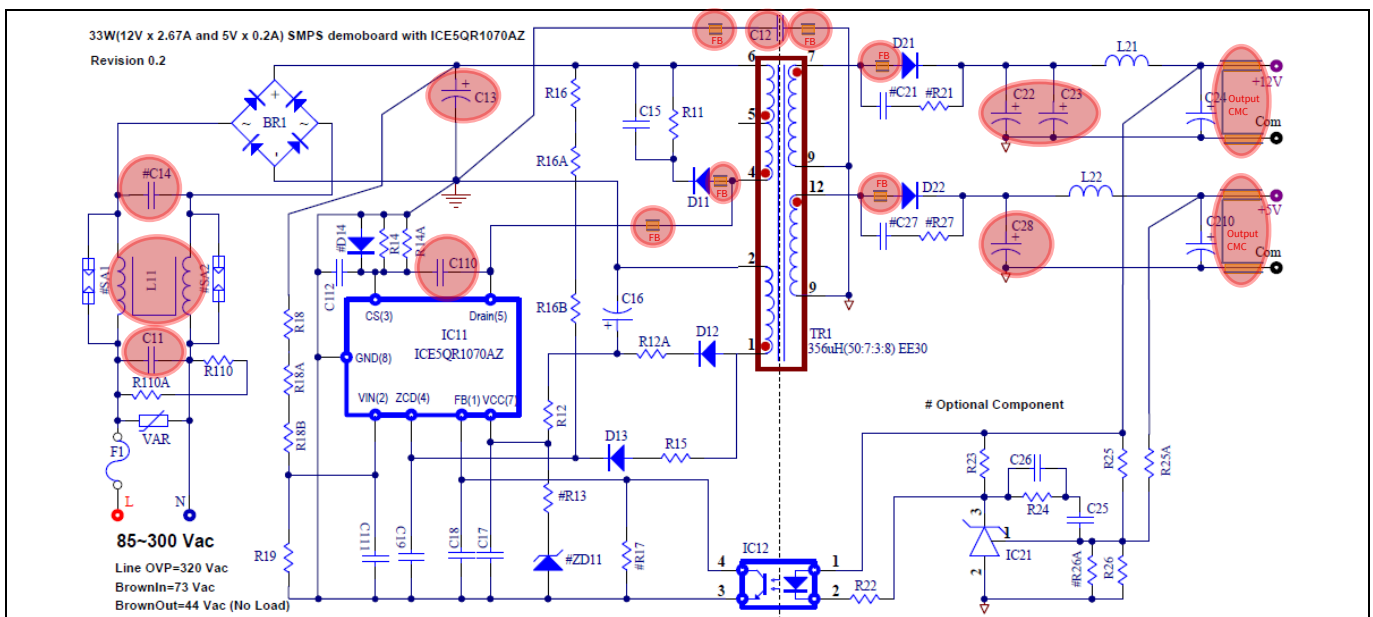

Figure 5 EMI reduction tips

#### Circuit description

- Adding drain to CS capacitor C110 for the MOSFET of the CoolSET™ can reduce the high switching noise. However, it also reduces efficiency.
- Adding a ferrite bead to the critical nodes of the circuit can help to reduce the HF noise, such as the connecting path between the transformer and the drain pin, clamper diode D11, output diodes (D21 and D22), Y-capacitor C12, etc.
- Adding additional output CM Choke (CMC) can also help to reduce the HF noise.

Transformer specification

### 8 Transformer specification

(Refer to Appendix A for transformer design and Appendix B for WE transformer specification.)

- Core and materials: EE30/15/7 (EF30), TP4A (TDG)
- Bobbin: 070-5313 (12-pin, THT, horizontal version)
- Primary inductance:  $L_p = 356 \mu\text{H}$  ( $\pm 10\%$ ), measured between pin 4 and pin 6
- Manufacturer and part number: Würth Electronics Midcom (750343534)

### Measurement data and graphs

- No-load condition (no load) : 5 V at 0 A and 12 V at 0 A
- Minimum load condition (min. load) : 5 V at 6 mA and 12 V 0 A
- 1/20 load condition (1/20 load) : 5 V at 10 mA and 12 V at 133 mA
- 1/10 load condition (1/10 load) : 5 V at 20 mA and 12 V at 266 mA
- Typical load condition (typ. load) : 5 V at 60 mA and 12 V at 1 A
- 1/4 load condition (1/4 load) : 5 V at 50 mA and 12 V at 0.668 A
- 1/2 load condition (1/2 load) : 5 V at 100 mA and 12 V at 1.355 A
- 3/4 load condition (3/4 load) : 5 V at 150 mA and 12 V at 2.002 A
- Maximum load condition (max. load) : 5 V at 200 mA and 12 V at 2.66 A

## 9.1 Load regulation

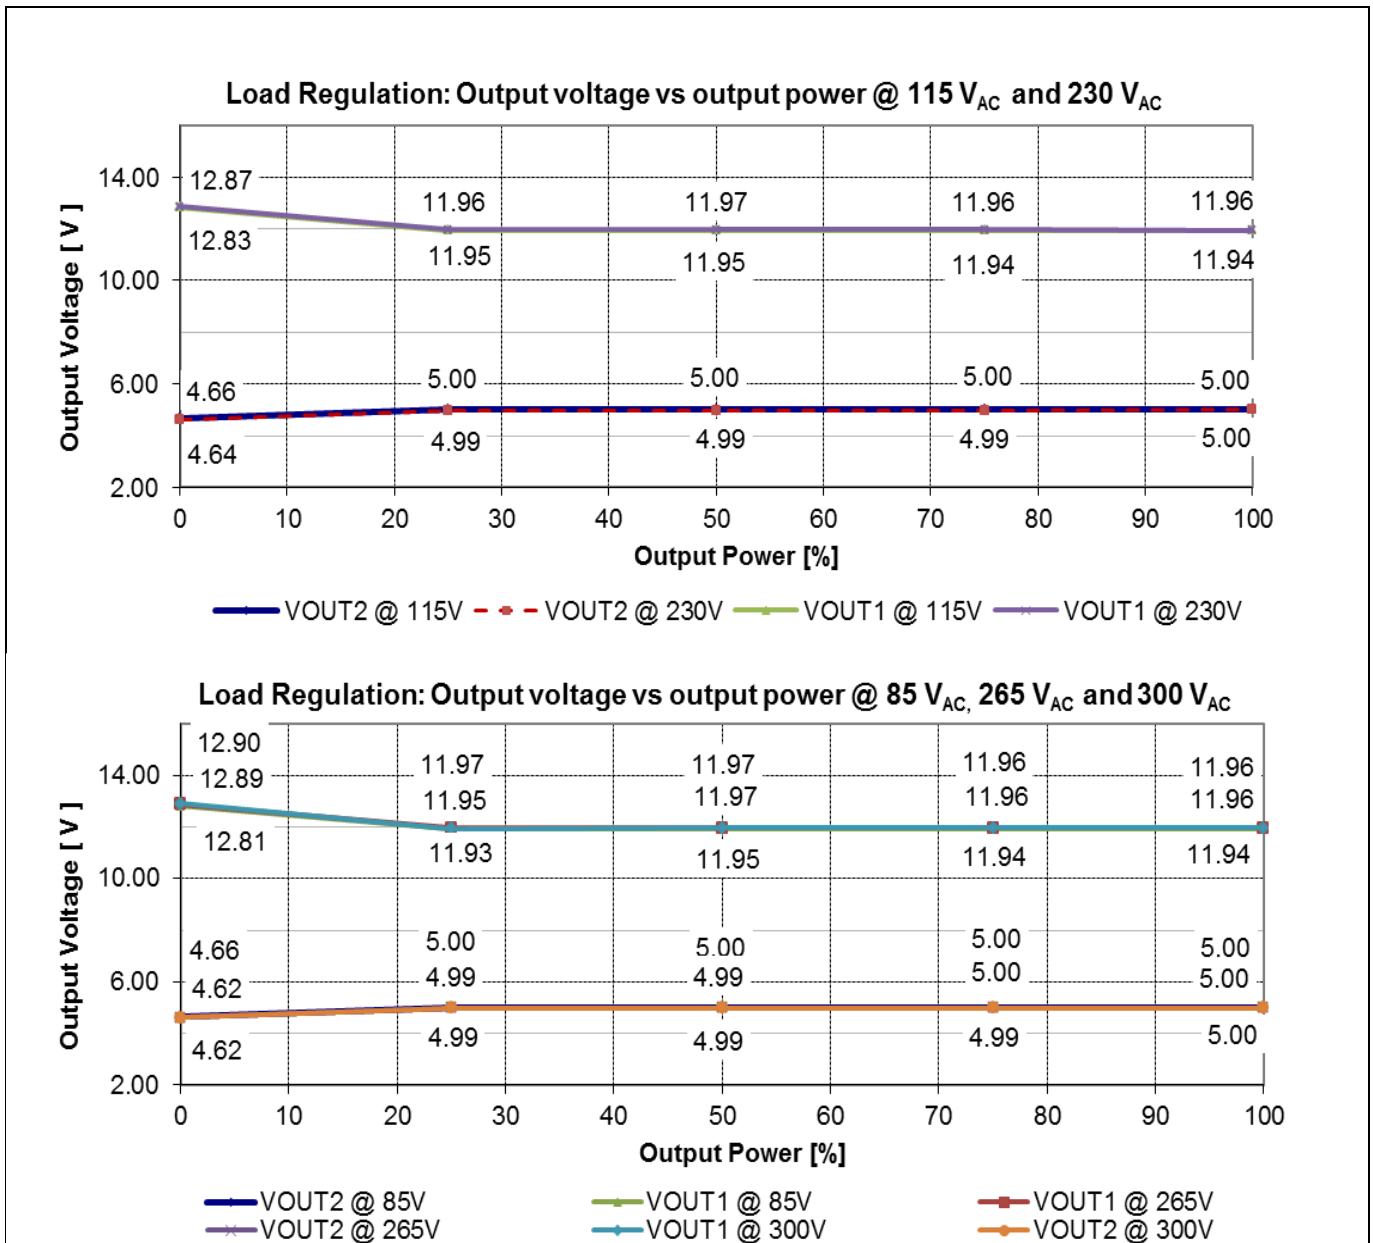

Figure 9 Load regulation V<sub>OUT</sub> vs output power

## 9.2 Line regulation

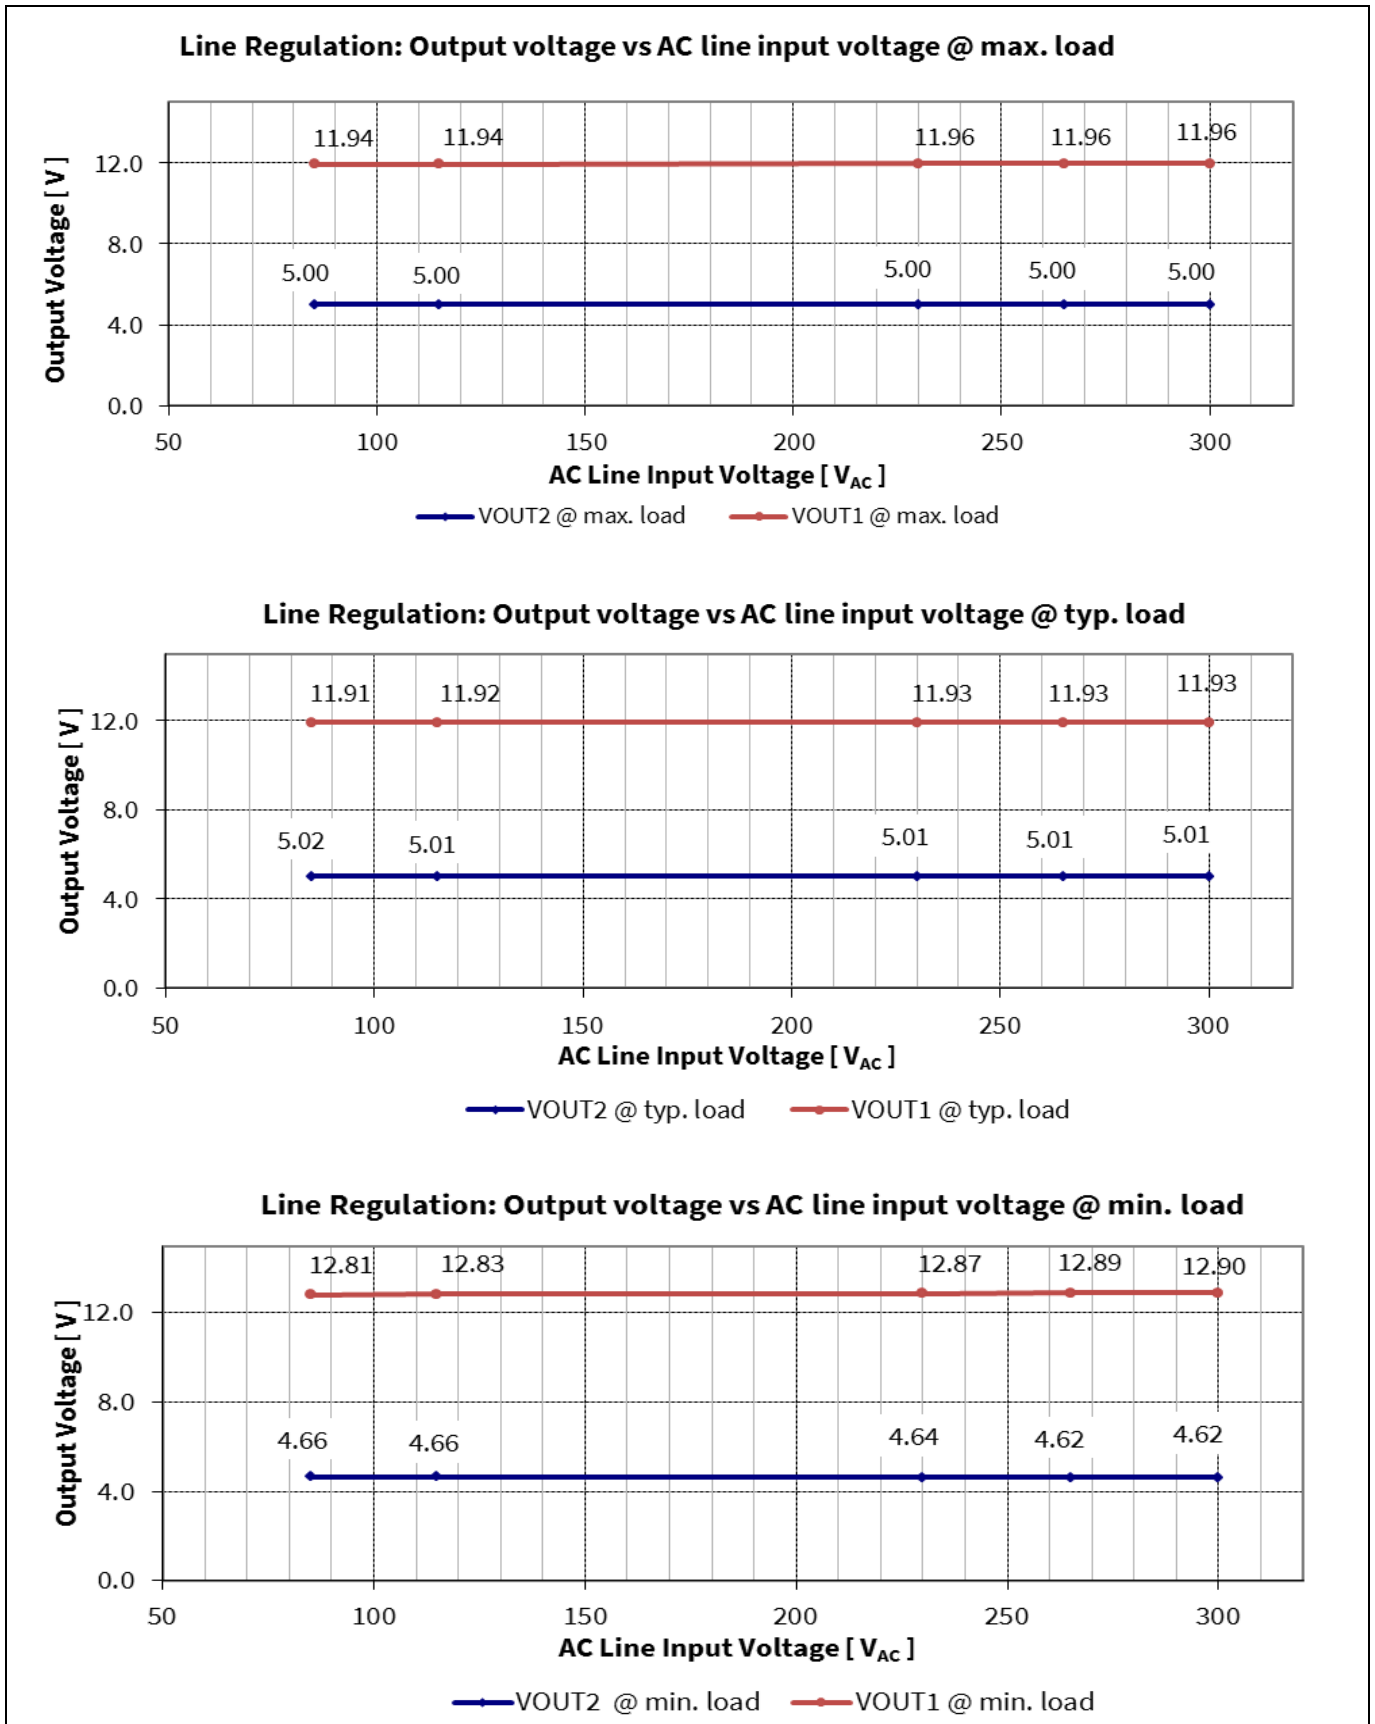

Figure 10 Line regulation: V<sub>OUT</sub> vs AC-line input voltage

### 9.3 Efficiency vs AC-line input voltage

Figure 11 Efficiency vs AC-line input voltage

### 9.4 Standby power

Figure 12 Standby power at no load ( $P_{stby\_NL}$ ) and 30 mW load ( $P_{stby\_ML}$ ) vs AC-line input voltage (measured by Yokogawa WT210 power meter – integration mode)

### 9.5 Maximum input power

Figure 13 Maximum input power (before over-load protection) vs AC-line input voltage

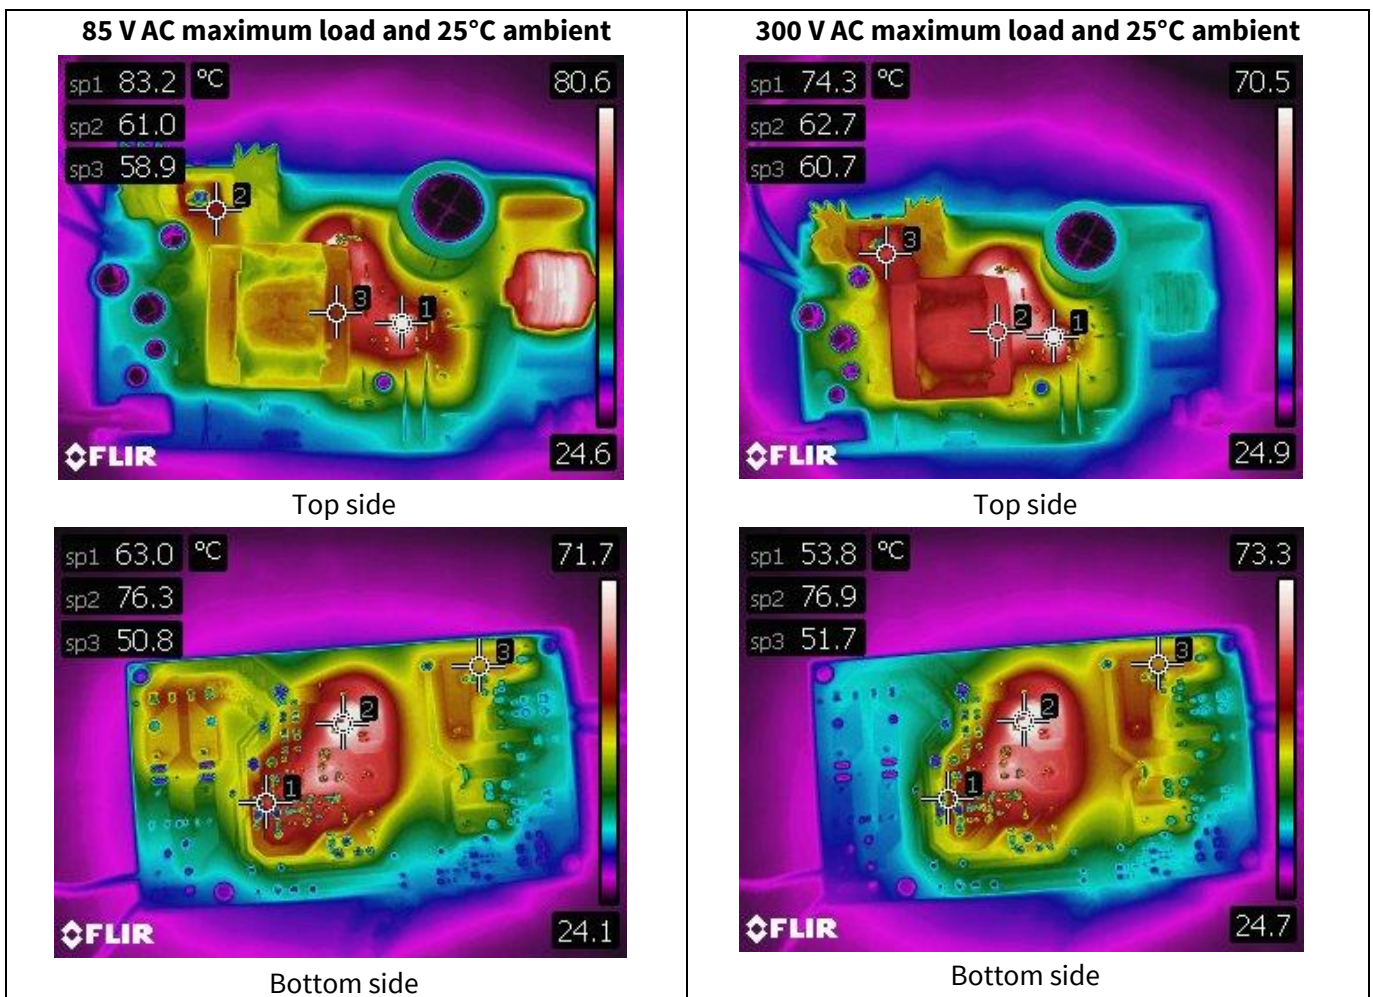

Thermal performance

## 10 Thermal performance

The thermal testing of the reference board was done in the open air without forced ventilation at an ambient temperature of 25°C. An infrared thermography camera (FLIR-T62101) was used to capture the thermal reading of particular components. The measurements were taken at the maximum load running for one hour. The tested input voltage was 85 V AC and 300 V AC.

**Table 5 Component temperature at full load (12 V 2.66 A and 5 V 0.2 A) under T<sub>amb</sub> = 25°C**

Circuit code	Major component	85 V AC (°C)	300 V AC (°C)
BR1	Bridge diode	57.2	38.0
D21	+ 12 V output diode	61	60.7
D22	+ 5 V output diode	48.2	48.3
IC11	ICE5QR1070AZ	83.2	74.3
L11	Input CMC choke	80.6	38.5
R11	Clamper resistor	85.4	87.1
R14	CS resistor	63.0	53.8
TR1	Main transformer	58.9	62.7
	Ambient	25.0	25.0

**Figure 14 Infrared thermal image of REF\_5QR1070AZ\_33W1**

### Waveforms

## 11 Waveforms

All waveforms and scope plots were recorded with a Teledyne LeCroy 606Zi oscilloscope.

### 11.1 Start-up at low/high AC-line input voltage with maximum load

Figure 15 Start-up

### 11.2 Switching waveform at maximum load

Figure 16 Drain and CS voltage at maximum load

# 33 W auxiliary SMPS for refrigerator using ICE5QR1070AZ

## REF\_5QR1070AZ\_33W1

### Waveforms

### 11.3 Switching waveform at 25% load

- 25% load (5 V 0.05 A, 12 V 0.667 A)

Figure 17 Drain and CS voltage at 25% load

### 11.4 Output ripple voltage at maximum load

Probe terminal end with decoupling capacitor of 0.1 μF (ceramic) and 1 μF (electrolytic), 20 MHz BW

Figure 18 Output ripple voltage at maximum load

### Waveforms

#### 11.5 Output ripple voltage in ABM 1 W load

- Probe terminal end with decoupling capacitor of 0.1  $\mu\text{F}$  (ceramic) and 1  $\mu\text{F}$  (electrolytic), 20 MHz BW
- Load: 1 W (5 V at 6 mA and 12 V at 80mA)

**Figure 19** Output ripple voltage in ABM 1 W load

#### 11.6 Load transient response (dynamic load from 10% to 100%)

- Probe terminal end with decoupling capacitor of 0.1  $\mu\text{F}$  (ceramic) and 1  $\mu\text{F}$  (electrolytic), 20 MHz BW
- V load change from 10% to 100% and 5 V at 200 mA load, 100 Hz, 0.4 A/ $\mu\text{s}$  slew rate

**Figure 20** Load transient response

Waveforms

11.7 Line OVP Protection (OVP) (non-switch auto restart)

- Increase AC-line voltage gradually at maximum load until line OVP is detected and then decrease the AC-line until line OVP reset detected.

C1 (yellow): V<sub>Bus</sub>; C2 (purple): V<sub>CC</sub>; C3 (blue): V<sub>VIN</sub>; C4 (green): V<sub>CS</sub>

Max. load; line OVP triggered: 320 V AC (V<sub>Bus</sub> > 445 V DC or V<sub>VIN</sub> > 2.9 V); line OVP reset: 320 V AC (V<sub>Bus</sub> < 445 V DC or V<sub>VIN</sub> < 2.9 V)

Figure 21 Line OVP

11.8 Brown-in/Brown-out protection (non-switch auto restart)

- Increase AC-line voltage gradually at 1 W load (5 V at 6 mA and 12 V at 80 mA) until the system starts up (brown-in) and then reduce the AC-line until the system shut-down (brown-out)

C1 (yellow): V<sub>Bus</sub>; C2 (purple): V<sub>CC</sub>; C3 (blue): V<sub>VIN</sub>; C4 (green): V<sub>CS</sub>

1 W load; brown-in: 75 V AC (V<sub>Bus</sub> > 106 V DC or V<sub>VIN</sub> > 0.66 V); brown-out: 43 V AC (V<sub>Bus</sub> < 63 V DC or V<sub>VIN</sub> < 0.4 V)

Figure 22 Brown-in/Brown-out protection

Waveforms

### 11.9 Over-load protection (odd-skip auto restart)

- $V_{OUT1}$  (12 V) short-to-GND at 85 V AC

C1 (yellow):  $V_{drain}$ ; C2 (purple):  $V_{CC}$ ; C3 (blue):  $V_{FB}$

$V_{IN}$  = 85 V AC; system enters OLP auto-restart mode

Figure 23 Over-load protection (OLP)

### 11.10 Output OV protection (odd-skip auto restart)

- Short resistor R26 during system operation at no load at 85 V AC

C1 (yellow):  $V_{CC}$ ; C2 (purple):  $V_{CC}$ ; C3 (blue):  $V_{OUT1}$  (12 V); C4 (green):  $V_{CS}$

$V_{IN}$  = 85 V AC, no load; when  $V_{OUT1}$  (12 V) increase to hit 15 V, the system enters output OVP auto-restart mode

Figure 24 Output OV protection

Waveforms

11.11 Conducted emissions (EN 55022 class B)

Equipment: Schaffner SMR4503 (receiver); standard: EN 55022 (CISPR 22) class B; test conditions:  $V_{IN} = 115\text{ V AC}$  and  $230\text{ V AC}$ , load:  $33\text{ W}$  ( $12\text{ V } 4.5\ \Omega$ ,  $5\text{ V } 25\ \Omega$ ).

- Pass conducted emissions EN 55022 (CISPR 22) class B with greater than 12 dB margin for quasi-peak measurement at low-line ( $115\text{ V AC}$ ) and greater than 6 dB margin for quasi-peak measurement at high-line ( $230\text{ V AC}$ ).

Figure 25 Conducted emissions at 115 V AC line and 33 W load - > 12 dB margin

Figure 26 Conducted emissions at 115 V AC neutral and 33 W load - > 15 dB margin

Waveforms

Figure 27 Conducted emissions at 230 V AC line and 33 W load - > 6 dB margin

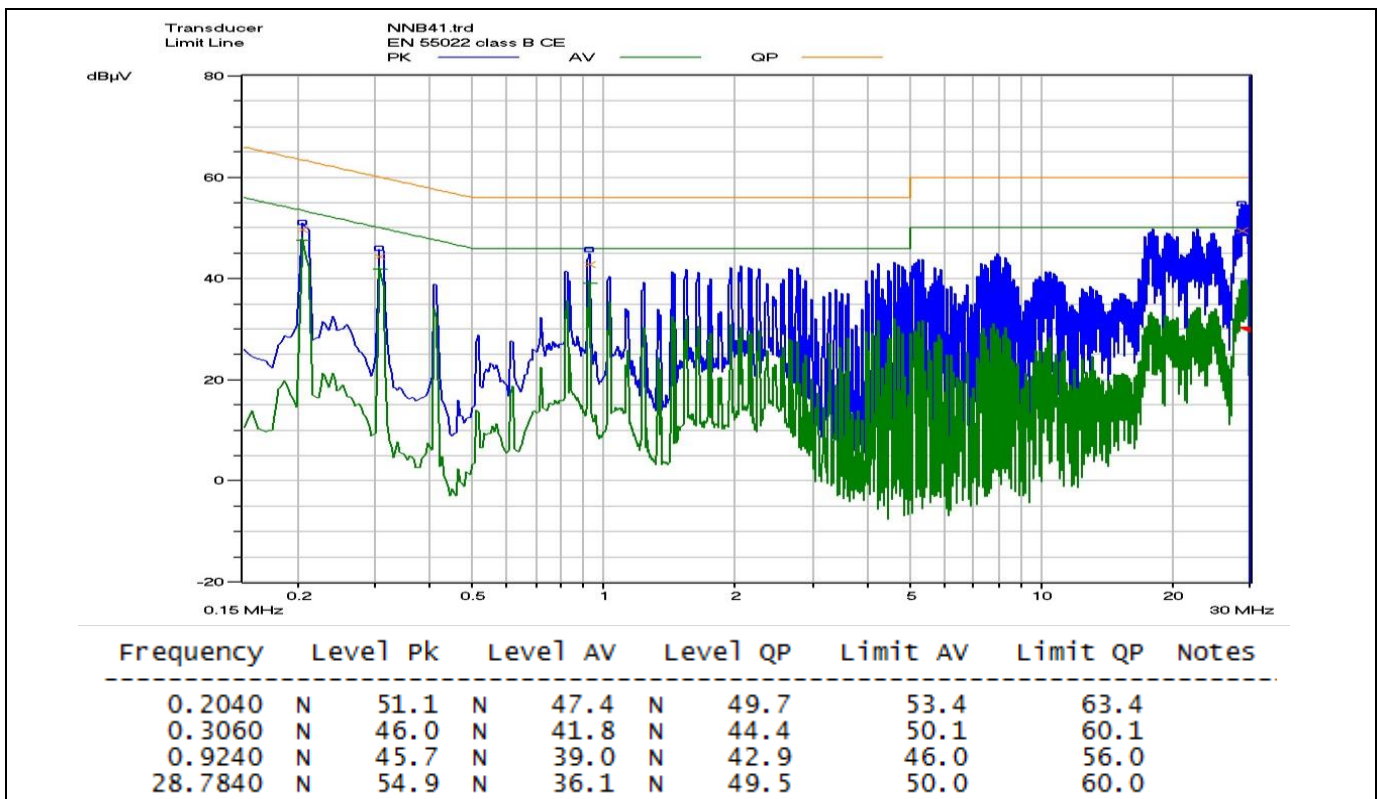

Figure 28 Conducted emissions at 230 V AC neutral and 33 W load - > 7 dB margin

Waveforms

**11.12 ESD immunity (EN 61000-4-2)**

This system was subjected to a  $\pm 10$  kV ESD test according to EN 61000-4-2 for both contact and air discharge. A test failure was defined as non-recoverable.

- Air discharge: pass  $\pm 10$  kV; contact discharge: pass  $\pm 10$  kV.

**Table 6 System ESD test result**

Description	ESD test	level	Number of strikes				Test result
			+V <sub>OUT1</sub>	-V <sub>OUT1</sub>	+V <sub>OUT2</sub>	-V <sub>OUT2</sub>	
115 V AC, 33 W (12 V 4.5 $\Omega$ , 5 V 25 $\Omega$ )	Contact	+10 kV	10	10	10	10	PASS
		-10 kV	10	10	10	10	PASS
	Air	+10 kV	10	10	10	10	PASS
		-10 kV	10	10	10	10	PASS
230 V AC, 33 W (12 V 4.5 $\Omega$ , 5 V 25 $\Omega$ )	Contact	+10 kV	10	10	10	10	PASS
		-10 kV	10	10	10	10	PASS
	Air	+10 kV	10	10	10	10	PASS
		-10 kV	10	10	10	10	PASS

**11.13 Surge immunity (EN 61000-4-5)**

This system was subjected to a surge immunity test ( $\pm 2$  kV DM and  $\pm 4$  kV CM) according to EN 61000-4-5. A test failure was defined as a non-recoverable.

- DM: pass  $\pm 2$  kV; CM: pass  $\pm 4$  kV.

**Table 7 System surge immunity test result**

Description	Test	Level		Number of strikes				Test result
				0°	90°	180°	270°	
115 V AC, 33 W (12 V 4.5 $\Omega$ , 5 V 25 $\Omega$ )	DM	+2 kV	L $\rightarrow$ N	3	3	3	3	PASS
		-2 kV	L $\rightarrow$ N	3	3	3	3	PASS
	CM	+4 kV	L $\rightarrow$ G	3	3	3	3	PASS

**IMPORTANT NOTICE**

The information contained in this application note is given as a hint for the implementation of the product only and shall in no event be regarded as a description or warranty of a certain functionality, condition or quality of the product. Before implementation of the product, the recipient of this application note must verify any function and other technical information given herein in the real application. Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind (including without limitation warranties of non-infringement of intellectual property rights of any third party) with respect to any and all information given in this application note.

The data contained in this document is exclusively intended for technically trained staff. It is the responsibility of customer's technical departments to evaluate the suitability of the product for the intended application and the completeness of the product information given in this document with respect to such application.

For further information on the product, technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies office ([www.infineon.com](http://www.infineon.com)).

**WARNINGS**

Due to technical requirements products may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies office.

Except as otherwise explicitly approved by Infineon Technologies in a written document signed by authorized representatives of Infineon Technologies, Infineon Technologies' products may not be used in any applications where a failure of the product or any consequences of the use thereof can reasonably be expected to result in personal injury.

## Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
