## Dual Output 3/4 Phase +1/0 Phase Controller with Single SVID Interface for Desktop and Notebook CPU Applications

The NCP6153 dual output four plus one phase buck solution is optimized for Intel VR12 compatible CPUs. The controller combines true differential voltage sensing, differential inductor DCR current sensing, input voltage feed-forward, and adaptive voltage positioning to provide accurately regulated power for both Desktop and Notebook applications. The control system is based on Dual-Edge pulse-width modulation (PWM) combined with DCR current sensing providing the fastest initial response to dynamic load events and reduced system cost. It also sheds to single phase during light load operation and can auto frequency scale in light load while maintaining excellent transient performance.

Dual high performance operational error amplifiers are provided to simplify compensation of the system. Patented Dynamic Reference Injection further simplifies loop compensation by eliminating the need to compromise between closed-loop transient response and Dynamic VID performance. Patented Total Current Summing provides highly accurate current monitoring for droop and digital current monitoring.

### Features

- Meets Intel VR12/IMVP7 Specifications
- Current Mode Dual Edge Modulation for Fastest Initial Response to Transient Loading
- Dual High Performance Operational Error Amplifier
- One Digital Soft Start Ramp for Both Rails
- Dynamic Reference Injection
- Accurate Total Summing Current Amplifier
- DAC with Droop Feed-forward Injection
- Dual High Impedance Differential Voltage and Total Current Sense Amplifiers
- Phase-to-Phase Dynamic Current Balancing
- “Lossless” DCR Current Sensing for Current Balancing
- Summed Thermally Compensated Inductor Current Sensing for Droop
- True Differential Current Balancing Sense Amplifiers for Each Phase
- Adaptive Voltage Positioning (AVP)

- Switching Frequency Range of 200 kHz – 1.0 MHz
- Startup into Pre-Charged Loads While Avoiding False OVP
- Power Saving Phase Shedding
- Vin Feed Forward Ramp Slope
- Pin Programming for Internal SVID Parameters
- Over Voltage Protection (OVP) and Under Voltage Protection (UVP)
- Over Current Protection (OCP)
- Dual Power Good Output with Internal Delays
- These Devices are Pb-Free and are RoHS Compliant

### Applications

- Desktop & Notebook Processors
- Server Processors and Memory Power

ON Semiconductor®

## NCP6153 QFN52 SINGLE ROW PIN CONFIGURATIONS

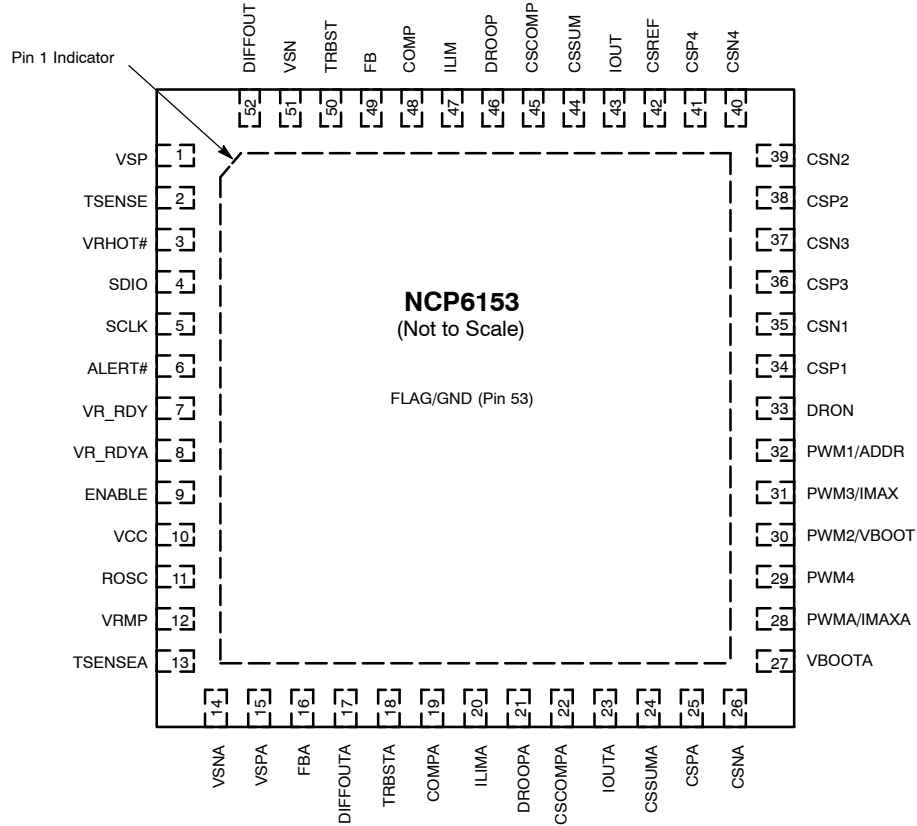

Figure 2. Pinout (Top View)

## NCP6153 QFN52 SINGLE ROW PIN DESCRIPTIONS

Pin No.	Symbol	Description
1	VSP	Non-inverting input to the core differential remote sense amplifier
2	TSENSE	Temp Sense input for the multiphase converter
3	VR_HOT#	Thermal logic output for over temperature
4	SDIO	Serial VID data interface
5	SCLK	Serial VID clock
6	ALERT#	Serial VID ALERT#.
7	VR_RDY	Open drain output. High indicates that the core output is regulating
8	VR_RDYA	Open drain output. High indicates that the aux output is regulating
9	ENABLE	Logic input. Logic high enables both outputs and logic low disables both outputs
10	VCC	Power for the internal control circuits. A decoupling capacitor is connected from this pin to ground
11	ROSC	A resistance from this pin to ground programs the oscillator frequency. This pin supplies a trimmed output voltage of 2 V
12	VRMP	Feed-forward input of Vin for the ramp slope compensation. The current fed into this pin is used to control the ramp of PWM slope
13	TSENSEA	Temp Sense input for the single phase converter
14	VSNA	Inverting input to the aux differential remote sense amplifier
15	VSPA	Non-inverting input to the aux differential remote sense amplifier
16	FBA	Error amplifier voltage feedback for aux output

# NCP6153

## NCP6153 QFN52 SINGLE ROW PIN DESCRIPTIONS

Pin No.	Symbol	Description
17	DIFFOUTA	Output of the aux differential remote sense amplifier
18	TRBSTA	Compensation pin for aux rail load transient boost
19	COMPA	Output of the aux error amplifier and the inverting input of the PWM comparator for aux output
20	ILIMA	Over current shutdown threshold setting for aux output. A resistor to CSCOMPA sets the threshold
21	DROOPA	Used to program droop function for aux output. It's connected to the resistor divider placed between CSCOMPA and CSREFA
22	CSCOMPA	Output of total current sense amplifier for aux output
23	IOUTA	Total output current monitor for aux output
24	CSSUMA	Inverting input of total current sense amplifier for aux output
25	CSPA	Non-Inverting input to aux current sense amplifier
26	CSNA	Inverting input to aux current sense amplifier
27	VBOOTA	VBOOTA Voltage input pin. Set to adjust the aux boot-up voltage
28	PWMA/IMAXA	Aux PWM output to gate driver. Also as ICC_MAXA input pin for aux rail. During start up it is used to program ICC_MAXA with a resistor to ground
29	PWM4	Phase 4 PWM output. Pull to Vcc will configure as 3-phase operation
30	PWM2/VBOOT	Phase 2 PWM output. Also as VBOOT input pin to adjust the core rail boot-up voltage. During start up it is used to program VBOOT with a resistor to ground
31	PWM3/IMAX	Phase 3 PWM output. Also as ICC_MAX Input Pin for core rail. During start up it is used to program ICC_MAX with a resistor to ground
32	PWM1/ADDR	Phase 1 PWM output. Also as Address program pin. A resistor to ground on this pin programs the SVID address of the device
33	DRON	Bidirectional gate drive enable for core output
34	CSP1	Non-inverting input to current balance sense amplifier for phase 1
35	CSN1	Inverting input to current balance sense amplifier for phase 1
36	CSP3	Non-inverting input to current balance sense amplifier for phase 3
37	CSN3	Inverting input to current balance sense amplifier for phase 3
38	CSP2	Non-inverting input to current balance sense amplifier for phase 2
39	CSN2	Inverting input to current balance sense amplifier for phase 2
40	CSN4	Inverting input to current balance sense amplifier
41	CSP4	Non-inverting input to current balance sense amplifier for phase 4
42	CSREF	Total output current sense amplifier reference voltage input
43	IOUT	Total output current monitor for core output.
44	CSSUM	Inverting input of total current sense amplifier for core output
45	CSCOMP	Output of total current sense amplifier for core output
46	DROOP	Used to program droop function for core output. It's connected to the resistor divider placed between CSCOMP and CSREF summing node
47	ILIM	Over current shutdown threshold setting for core output. Resistor to CSCOMP to set threshold
48	COMP	Output of the error amplifier and the inverting inputs of the PWM comparators for the core output
49	FB	Error amplifier voltage feedback for core output
50	TRBST	Compensation pin for core rail load transient boost.
51	VSN	Inverting input to the core differential remote sense amplifier
52	DIFFOUT	Output of the core differential remote sense amplifier
53	FLAG / GND	Power supply return (QFN Flag)

## ABSOLUTE MAXIMUM RATINGS

### ELECTRICAL INFORMATION

Pin Symbol	V <sub>MAX</sub>	V <sub>MIN</sub>
COMP, COMPA	V <sub>CC</sub> + 0.3 V	-0.3 V
CSCOMP, CSCOMPA	V <sub>CC</sub> + 0.3 V	-0.3 V
VSN	GND + 300 mV	GND - 300 mV
DIFFOUT, DIFFOUTA	V <sub>CC</sub> + 0.3 V	-0.3 V
VR_RDY, VR_RDYA	V <sub>CC</sub> + 0.3 V	-0.3 V
VCC	6.5 V	-0.3 V
ROSC	V <sub>CC</sub> + 0.3 V	-0.3 V
IOUT, IOUTA Output	2.0 V	-0.3 V
VRMP	+25 V	-0.3 V
All Other Pins	V <sub>CC</sub> + 0.3 V	-0.3 V

\*All signals referenced to GND unless noted otherwise.

### THERMAL INFORMATION

Description	Symbol	Typ	Unit
Thermal Characteristic – QFN Package (Note 1)	R <sub>θJA</sub>	68	°C/W
Operating Junction Temperature Range (Note 2)	T <sub>J</sub>	-10 to 125	°C
Operating Ambient Temperature Range		-10 to 100	°C
Maximum Storage Temperature Range	T <sub>STG</sub>	-40 to +150	°C
Moisture Sensitivity Level – QFN Package	MSL	1	

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

\*The maximum package power dissipation must be observed.

1. JESD 51-5 (1S2P Direct-Attach Method) with 0 LFM
2. JESD 51-7 (1S2P Direct-Attach Method) with 0 LFM

### NCP6153 ELECTRICAL CHARACTERISTICS Unless otherwise stated: -10°C < T<sub>A</sub> < 100°C; V<sub>CC</sub> = 5 V; C<sub>VCC</sub> = 0.1 μF

Parameter	Test Conditions	Min	Typ	Max	Unit
-----------	-----------------	-----	-----	-----	------

#### ERROR AMPLIFIER

Input Bias Current	@ 1.3 V	-400		400	nA
Open Loop DC Gain	C <sub>L</sub> = 20 pF to GND, R <sub>L</sub> = 10 kΩ to GND		80		dB
Open Loop Unity Gain Bandwidth	C <sub>L</sub> = 20 pF to GND, R <sub>L</sub> = 10 kΩ to GND		50		MHz
Slew Rate	ΔV <sub>in</sub> = 100 mV, G = -10 V/V, ΔV <sub>out</sub> = 1.5 V - 2.5 V, C <sub>L</sub> = 20 pF to GND, DC Load = 10 k to GND		20		V/μs
Maximum Output Voltage	I <sub>SOURCE</sub> = 2.0 mA	3.5	-	-	V
Minimum Output Voltage	I <sub>SINK</sub> = 2.0 mA	-	-	1	V

#### DIFFERENTIAL SUMMING AMPLIFIER

Input Bias Current	VSP, VSPA, VSN, VSNA = 1.3 V	-400	-	400	nA
VSP Input Voltage Range		-0.3	-	3.0	V
VSN Input Voltage Range		-0.3	-	0.3	V

3. Guaranteed by design or characterization data, not in production test.

**NCP6153 ELECTRICAL CHARACTERISTICS** Unless otherwise stated:  $-10^{\circ}\text{C} < T_A < 100^{\circ}\text{C}$ ;  $V_{CC} = 5\text{ V}$ ;  $C_{VCC} = 0.1\text{ }\mu\text{F}$

Parameter	Test Conditions	Min	Typ	Max	Unit
-----------	-----------------	-----	-----	-----	------

## DIFFERENTIAL SUMMING AMPLIFIER

-3 dB Bandwidth	$C_L = 20\text{ pF to GND}$ , $R_L = 10\text{ k}\Omega\text{ to GND}$		21		MHz
Closed Loop DC gain	$V_{S+}\text{ to }V_{S-} = 0.5\text{ to }1.3\text{ V}$		1.0		V/V
Droop Accuracy	$CSREF - DROOP = 80\text{ mV}$ $DAC = 0.8\text{ V to }1.2\text{ V}$	-81.5		-78.5	mV

## CURRENT SUMMING AMPLIFIER

Offset Voltage ( $V_{OS}$ ) (Note 3)	$-10^{\circ}\text{C} < T_A < 85^{\circ}\text{C}$	-500		500	$\mu\text{V}$
Input Bias Current	$CSSUM = CSREF = 1\text{ V}$	-7.5		7.5	nA
Open Loop Gain			80		dB
Current Sense Unity Gain Bandwidth	$C_L = 20\text{ pF to GND}$ , $R_L = 10\text{ k}\Omega\text{ to GND}$		10		MHz
Maximum CSCOMP (A) Output Voltage	$I_{source} = 2\text{ mA}$ $CSSUM(A) = CSCOMP(A)$	3.5	-	-	V
Minimum CSCOMP(A) Output Voltage	$I_{sink} = 2\text{ mA}$ $CSSUM(A) = CSCOMP(A)$	-	-	0.35	V

## CURRENT BALANCE AMPLIFIER

Input Bias Current	$CSP_{1-4} = CSN_{1-4} = 1.2\text{ V}$ $CSPA = CSNA = 1.2\text{ V}$	-50	-	50	nA
Common Mode Input Voltage Range	$CSPx = CSNx$	0	-	2.0	V
Differential Mode Input Voltage Range	$CSNx = 1.2\text{ V}$	-100	-	100	mV
Input Offset Voltage Matching	$CSPx = CSNx = 1.2\text{ V}$ , Measured from the average $-10^{\circ}\text{C} < T_A < 85^{\circ}\text{C}$	-1.5	-	1.5	mV
Current Sense Amplifier Gain	$0\text{ V} < CSPx - CSNx < 0.1\text{ V}$	5.6	6.0	6.4	V/V
Multiphase Current Sense Gain Matching	$CSN = CSP = 10\text{ mV to }30\text{ mV}$	-3		3	%
-3 dB Bandwidth			8		MHz

## INPUT SUPPLY

Supply Voltage Range		4.75		5.25	V
VCC Quiescent Current	EN = high		28	50	mA
	EN = low		0.01		mA
UVLO Threshold	$V_{CC}$ rising			4.5	V
	$V_{CC}$ falling	4.0			V
VCC UVLO Hysteresis		80	180		mV

## DAC SLEW RATE

Soft Start Slew Rate			2.5		mV/ $\mu\text{s}$
Slew Rate Slow			5		mV/ $\mu\text{s}$
Slew Rate Fast			20		mV/ $\mu\text{s}$
AUX Soft Start Slew Rate			2.5		mV/ $\mu\text{s}$
AUX Slew Rate Slow			2.5		mV/ $\mu\text{s}$
AUX Slew Rate Fast			10		mV/ $\mu\text{s}$

## ENABLE INPUT

Enable High Input Leakage Current	External 1 K pull-up to 3.3 V	-		1.0	$\mu\text{A}$
Upper Threshold	$V_{UPPER}$	0.8			V

3. Guaranteed by design or characterization data, not in production test.

# NCP6153

**NCP6153 ELECTRICAL CHARACTERISTICS** Unless otherwise stated:  $-10^{\circ}\text{C} < T_A < 100^{\circ}\text{C}$ ;  $V_{CC} = 5\text{ V}$ ;  $C_{VCC} = 0.1\text{ }\mu\text{F}$

Parameter	Test Conditions	Min	Typ	Max	Unit
-----------	-----------------	-----	-----	-----	------

## ENABLE INPUT

Lower Threshold	$V_{\text{LOWER}}$			0.3	V
Total Hysteresis	$V_{\text{UPPER}} - V_{\text{LOWER}}$		90		mV
Enable Delay Time	Measure time from Enable transitioning HI to when DRON goes high, $V_{\text{boot}}$ is not 0 V			5.0	ms

## DRVON

Output High Voltage	Sourcing 500 $\mu\text{A}$	3.0			V
Output Low Voltage	Sinking 500 $\mu\text{A}$			0.1	V
Rise/Fall Time	$C_L$ (PCB) = 20 pF, $\Delta V_O = 10\%$ to 90%	–	10		ns
Input High Threshold		2.5			V
Input Low Threshold				1.5	V
Internal Pull Down Resistance	EN = Low		70		k $\Omega$

## IOU / IOUA OUTPUT

Input Referred Offset Voltage	$I_{\text{limit}}$ to CSREF	–1.5		1.5	mV
Output Source Current	$I_{\text{limit}}$ source current = 80 $\mu\text{A}$			820	$\mu\text{A}$
Current Gain	$(I_{\text{OUT CURRENT}}) / (I_{\text{LIMIT CURRENT}})$ , $R_{\text{ILIM}} = 20\text{ k}$ , $R_{\text{IOUT}} = 5.0\text{ k}$ , DAC = 0.8 V, 1.25 V, 1.52 V	9.5	10	10.5	

## OSCILLATOR

Switching Frequency Range		200	–	1000	kHz
4 Phase Operation	$R_T = 10.5\text{ k}\Omega$	315	350	385	kHz
Rosc Output Voltage	$R_T = 10.5\text{ k}\Omega$	1.95	2.00	2.05	V

## OUTPUT OVER VOLTAGE AND UNDER VOLTAGE PROTECTION (OVP & UVP)

Absolute Over Voltage Threshold During Soft Start	CSREF, CSNA	1.9	2.3		V
Over Voltage Threshold Above DAC	VSP(A) rising	170	300		mV
Over Voltage Delay	VSP(A) rising to PWMx low		40		ns
Under Voltage Threshold Below DAC–DROOP	VSP(A) falling	250	300	350	mV
Under-voltage Delay			5		$\mu\text{s}$

## VR12 DAC

System Voltage Accuracy	$1.0\text{ V} \leq \text{DAC} < 1.52\text{ V}$ $0.8\text{ V} < \text{DAC} < 0.995\text{ V}$ $0.25\text{ V} < \text{DAC} < 0.795\text{ V}$	–0.5 –5 –8		0.5 5 8	% mV mV
Droop Feed-Forward Up Current	Measured on DROOP, DROOPA	55	65	72	$\mu\text{A}$
Droop Feed-Forward Down current	Measured on DROOP, DROOPA	19	25	31	
Droop Feed-Forward Pulse On-Time			0.16		$\mu\text{s}$

## OVERCURRENT PROTECTION (Core Rail)

ILIM Threshold Current (OCP shutdown after 50 $\mu\text{s}$ delay)	(PS0) $R_{\text{lim}} = 20\text{ k}$	9.0	10	11.0	$\mu\text{A}$
ILIM Threshold Current (immediate OCP shutdown)	(PS0) $R_{\text{lim}} = 20\text{ k}$	13.5	15	16.5	$\mu\text{A}$
ILIM Threshold Current (OCP shutdown after 50 $\mu\text{s}$ delay)	(PS1, PS2, PS3) $R_{\text{lim}} = 20\text{ k}$ , N = number of phases in PS0 mode		10/N		$\mu\text{A}$
ILIM Threshold Current (immediate OCP shutdown)	(PS1, PS2, PS3) $R_{\text{lim}} = 20\text{ k}$ , N = number of phases in PS0 mode		15/N		$\mu\text{A}$

3. Guaranteed by design or characterization data, not in production test.

**NCP6153 ELECTRICAL CHARACTERISTICS** Unless otherwise stated:  $-10^{\circ}\text{C} < T_A < 100^{\circ}\text{C}$ ;  $V_{CC} = 5\text{ V}$ ;  $C_{VCC} = 0.1\text{ }\mu\text{F}$

Parameter	Test Conditions	Min	Typ	Max	Unit
-----------	-----------------	-----	-----	-----	------

## OVERCURRENT PROTECTION (Core Rail)

Maximum Timer for OCP shutdown				55	$\mu\text{s}$
--------------------------------	--	--	--	----	---------------

## OVERCURRENT PROTECTION (+1 Rail)

ILIM Threshold Current (OCP shutdown after 50 $\mu\text{s}$ delay)	(PS0,1,2,3) $R_{lim} = 20\text{ k}$	9	10	11	$\mu\text{A}$
ILIM Threshold Current (immediate OCP shutdown)	(PS0,1,2,3) $R_{lim} = 20\text{ k}$	12.5	15	16.5	$\mu\text{A}$
Maximum Timer for OCP shutdown				55	$\mu\text{s}$
CSCOMP OCP Threshold		220			mV

## VRMP (VIN Monitor)

UVLO Threshold	VRMP falling	3.0	3.2	3.4	V
UVLO Hysteresis		600	800		mV
Leakage current	$V_{EN} = 0\text{ V}$ , $V_{VRMP} = 26\text{ V}$			0.5	$\mu\text{A}$

## MODULATORS (PWM COMPARATORS) FOR CORE AND AUX

Duty Cycle	COMP voltage when the PWM outputs remain LO		1.3	–	V
100% Duty Cycle	COMP voltage when the PWM outputs remain HI $V_{RMP} = 12.0\text{ V}$	–	2.5	–	V
PWM Ramp Duty Cycle Matching	COMP = 2 V, PWM $T_{on}$ matching		1		%
PWM Phase Angle Error	Between adjacent phases	–15		15	$^{\circ}$
Ramp Feed-forward Voltage range		5		20	V

## TRBST, TRBSTA

TRBST/COMP offset	TRBST Starts Sinking Current		350		mV
TRBST Sink Capability			500		$\mu\text{A}$

## VR\_HOT#

Output Low Voltage	$I_{VRHOT} = -4\text{ mA}$			0.3	V
Output Leakage Current	High Impedance State	–1.0	–	1.0	$\mu\text{A}$

## TSENSE/TSENSEA

Alert# Assert Threshold			500		mV
Alert# De-assert Threshold			515		mV
VRHOT Assert Threshold			485		mV
VRHOT Rising Threshold			495		mV
TSENSE Bias Current		114	120	126	$\mu\text{A}$

## ADC

Voltage Range		0		2	V
Total Unadjusted Error (TUE)		–1		+1	%
Differential Nonlinearity (DNL)	8-bit			1	LSB
Power Supply Sensitivity			$\pm 1$		%
Conversion Time			30		$\mu\text{s}$
Round Robin			90		$\mu\text{s}$

## VR\_RDY, VR\_RDYA (POWER GOOD) OUTPUT

Output Low Saturation Voltage	$I_{VR\_RDY(A)} = 4\text{ mA}$	–	–	0.3	V
Rise Time	External pull-up of 1 k $\Omega$ to 3.3 V, $C_{TOT} = 45\text{ pF}$ , $\Delta V_o = 10\%$ to 90%	–	100		ns

3. Guaranteed by design or characterization data, not in production test.

# NCP6153

**NCP6153 ELECTRICAL CHARACTERISTICS** Unless otherwise stated:  $-10^{\circ}\text{C} < T_A < 100^{\circ}\text{C}$ ;  $V_{CC} = 5\text{ V}$ ;  $C_{VCC} = 0.1\text{ }\mu\text{F}$

Parameter	Test Conditions	Min	Typ	Max	Unit
-----------	-----------------	-----	-----	-----	------

## VR\_RDY, VR\_RDYA (POWER GOOD) OUTPUT

Fall Time	External pull-up of 1 k $\Omega$ to 3.3 V, $C_{TOT} = 45\text{ pF}$ , $\Delta V_o = 90\%$ to 10%		10		ns
Output Voltage at Power-up	VR_RDY, VR_RDYA pulled up to 5 V via 2 k $\Omega$	–	–	1.0	V
Output Leakage Current When High	VR_RDY and VR_RDYA = 5.0 V	–1.0	–	1.0	$\mu\text{A}$
VR_RDY Delay (rising)	DAC = TARGET to VR_RDY		500		$\mu\text{s}$
VR_RDY Delay (falling)	From OCP or OVP	–	5	–	$\mu\text{s}$

## PWM OUTPUTS

Output High Voltage	Sourcing 500 $\mu\text{A}$	$V_{CC} - 0.2\text{ V}$	–	–	V
Output Mid Voltage	No Load, SetPS = 02	1.9	2.0	2.1	V
Output Low Voltage	Sinking 500 $\mu\text{A}$	–	–	0.7	V
Rise and Fall Time	CL (PCB) = 50 pF, $\Delta V_o = \text{GND to } V_{CC}$	–	10		ns

## IMAX, IMAXA, ADDR, VBOOT INPUTS

Sensing Current			10		$\mu\text{A}$
-----------------	--	--	----	--	---------------

## PHASE DETECTION

PWM Pin Source Current			100		$\mu\text{A}$
PWM Pin Threshold Voltage			3.3		V
Phase Detect Timer			20		$\mu\text{s}$

## SCLK, SDIO, ALERT#

$V_{IL}$	Input Low Voltage			0.4	V
$V_{IH}$	Input High Voltage	0.65			V
$V_{OH}$	Output High Voltage		1.05		V
Hysteresis Voltage		50			mV
$R_{ON}$	Buffer On Resistance (data line, ALERT#, and VRHOT)	4		13	$\Omega$
Leakage Current		–100		100	$\mu\text{A}$
Pad Capacitance (Note 3)				4.0	pF
VR clock to data delay ( $T_{co}$ ) (Note 3)		4		8.3	ns
Setup time ( $T_{su}$ ) (Note 3)		7			ns
Hold time ( $T_{hld}$ ) (Note 3)		14			ns

3. Guaranteed by design or characterization data, not in production test.

**Figure 6. State Diagram**

## NCP6153

### General

The NCP6153 is a dual output four/three phase plus one phase dual edge modulated multiphase PWM controller designed to meet the Intel VR12 specifications with a serial SVID control interface. The NCP6153 implements PS0, PS1, PS2 and PS3 power saving states. It is designed to work in notebook, desktop, and server applications.

For Core Rail:

Power Status	PWM Output Operating Mode
PS0	Multi-phase PWM interleaving output
PS1	Single-phase RPM CCM mode (PWM1 only, PWM2~4 stay in Mid)
PS2	Single-phase RPM DCM mode (PWM1 only, PWM2~4 stay in Mid)
PS3	Single-phase RPM DCM mode (PWM1 only, PWM2~4 stay in Mid)

For AUX Rail:

Power Status	PWM Output Operating Mode
PS0	PWM interleaving with Core Rail / RPM CCM mode
PS1	PWM interleaving with Core Rail / RPM CCM mode
PS2	RPM DCM mode
PS3	RPM DCM mode

VID code change is supported by SVID interface with three options as below:

Option	SVID Command Code	Feature	Register Address (Indicating the slew rate of VID code change)
SetVID_Fast	01h	> 10 mV/μs VID code change slew rate	24h
SetVID_Slow	02h	= 1/4 of SetVID_Fast VID code change slew rate	25h
SetVID_Decay	03h	No control, VID code down	N/A

### Serial VID

The NCP6153 supports the Intel serial VID interface. It communicates with the microprocessor through three wires (SCLK, SDIO, ALERT#). The table of supported registers is shown below.

Index	Name	Description	Access	Default
00h	Vendor ID	Uniquely identifies the VR vendor. The vendor ID assigned by Intel to ON Semiconductor is 0x1Ah	R	0x1Ah
01h	Product ID	Uniquely identifies the VR product. The VR vendor assigns this number.	R	0x51
02h	Product Revision	Uniquely identifies the revision or stepping of the VR control IC. The VR vendor assigns this data.	R	0x0A
05h	Protocol ID	Identifies the SVID Protocol the controller supports	R	0x01
06h	Capability	Informs the Master of the controller's Capabilities, 1 = supported, 0 = not supported Bit 7 = iout_format. Bit 7 = 0 when 1A = 1LSB of Reg 15h. Bit 7 = 1 when Reg 15 FFh = Icc_Max. Default = 1 Bit 6 = ADC Measurement of Temp Supported = 1 Bit 5 = ADC Measurement of Pin Supported = 0 Bit 4 = ADC Measurement of Vin Supported = 0 Bit 3 = ADC Measurement of Iin Supported = 0 Bit 2 = ADC Measurement of Pout Supported = 1 Bit 1 = ADC Measurement of Vout Supported = 1 Bit 0 = ADC Measurement of Iout Supported = 1	R	0xC7
07h	Generic ID	51h or 31h, depending on the generic	R	51h or 31h
10h	Status_1	Data register read after the ALERT# signal is asserted. Conveying the status of the VR.	R	00h

## NCP6153

Index	Name	Description	Access	Default
11h	Status_2	Data register showing optional status_2 data.	R	00h
12h	Temp zone	Data register showing temperature zones the system is operating in	R	00h
15h	I_out	8 bit binary word ADC of current. This register reads 0xFF when the output current is at Icc_Max	R	01h
16h	V_out	8 bit binary word ADC of output voltage, measured between VSP and VSN. LSB size is 8 mV	R	01h
17h	VR_Temp	8 bit binary word ADC of voltage. Binary format in deg C, IE 100C = 64h. A value of 00h indicates this function is not supported	R	01h
18h	P_out	8 bit binary word representative of output power. The output voltage is multiplied by the output current value and the result is stored in this register. A value of 00h indicates this function is not supported	R	01h
1Ch	Status 2 Last read	When the status 2 register is read its contents are copied into this register. The format is the same as the Status 2 Register.	R	00h
21h	Icc_Max	Data register containing the Icc_Max the platform supports. The value is measured on the ICCMAX pin on power up and placed in this register. From that point on the register is read only.	R	00h
22h	Temp_Max	Data register containing the max temperature the platform supports and the level VR_hot asserts. This value defaults to 100°C and programmable over the SVID Interface	R/W	64h
24h	SR_fast	Slew Rate for SetVID_fast commands. Binary format in mV/μs.	R	0Ah
25h	SR_slow	Slew Rate for SetVID_slow commands. It is 4X slower than the SR_fast rate. Binary format in mV/μs	R	02h
26h	Vboot	The Vboot is programmed using resistors on the Vboot pin which is sensed on power up. The controller will ramp to Vboot and hold at Vboot until it receives a new SVID SetVID command to move to a different voltage.	R	00h
30h	Vout_Max	Programmed by master and sets the maximum VID the VR will support. If a higher VID code is received, the VR should respond with "not supported" acknowledge. VR 12 VID format.	RW	FBh
31h	VID setting	Data register containing currently programmed VID voltage. VID data format.	RW	00h
32h	Pwr State	Register containing the current programmed power state.	RW	00h
33h	Offset	Sets offset in VID steps added to the VID setting for voltage margining. Bit 7 is sign bit, 0 = positive margin, 1 = negative margin. Remaining 7 BITS are # VID steps for margin 2s complement. 00h = no margin 01h = +1 VID step 02h = +2 VID steps FFh = -1 VID step FEh = -2 VID steps.	RW	00h
34h	MultiVR Config			

### Boot Voltage Programming

The NCP6153 has a Vboot voltage register that can be externally programmed for each output. The VBOOTA also provides a feature that allows the “+1” single phase output to be disabled and effectively removed from the SVID bus. If the single phase output is disabled it alters the SVID address setting table to allow the multi-phase rail to show up at an even or odd address. See the Boot Voltage Table below.

**Table 3. BOOT VOLTAGE TABLE**

Boot Voltage (V)	Resistor Value (Ω)
0	10k
0.9	25k
1.0	45k
1.1	70k
1.2	95k
1.35	125k
1.5	165k
VCC	Shutdown (VbootA only)

### Addressing Programming

The NCP6153 supports seven possible dual SVID device addresses and eight possible single device addresses. Pin 32 (PWM1/ADDR) is used to set the SVID address. On power up a 10 μA current is sourced from this pin through a resistor connected to this pin and the resulting voltage is measured. The two tables below provide the resistor values for each corresponding SVID address. For dual addressing follow the Dual SVID Address Table. The address value is latched at startup. If VBOOTA is pulled to VCC the aux rail will be removed from the SVID bus, the address will then follow the Single Address SVID table below.

**Table 4. DUAL SVID ADDRESS TABLE**

Resistor Value	Main Rail SVID Address	Aux Rail SVID Address
10k	0000	0001
25k	0010	0011
45k	0100	0101
70k	0110	0111
95k	1000	1001
125k	1010	1011
165k	1100	1101

**Table 5. SINGLE SVID ADDRESS TABLE**

Resistor Value	Main Rail SVID Address (VBOOTA tied to VCC)
10k	0000
22k	0001
36k	0010
51k	0011
68k	0100
91k	0101
120k	0110
160k	0111
220k	1000

### Remote Sense Amplifier

A high performance high input impedance true differential amplifier is provided to accurately sense the output voltage of the regulator. The VSP and VSN inputs should be connected to the regulator’s output voltage sense points. The remote sense amplifier takes the difference of the output voltage with the DAC voltage and adds the droop voltage to

$$V_{\text{DIFFOUT}} = (V_{\text{VSP}} - V_{\text{VSN}}) + (1.3 \text{ V} - V_{\text{DAC}}) + (V_{\text{DROOP}} - V_{\text{CSREF}}) \quad (\text{eq. 1})$$

This signal then goes through a standard error compensation network and into the inverting input of the error amplifier. The non-inverting input of the error amplifier is connected to the same 1.3 V reference used for the differential sense amplifier output bias.

### High Performance Voltage Error Amplifier

A high performance error amplifier is provided for high bandwidth transient performance. A standard type 3 compensation circuit is normally used to compensate the system.

### Differential Current Feedback Amplifiers

Each phase has a low offset differential amplifier to sense that phase current for current balance and per phase OCP protection during soft-start. The inputs to the CSNx and CSPx pins are high impedance inputs. It is recommended that any external filter resistor RCSN does not exceed 10 kΩ to avoid offset issues with leakage current. It is also recommended that the voltage sense element be no less than 0.5 mΩ for accurate current balance. Fine tuning of this time constant is generally not required. The individual phase current is summed into the PWM comparator feedback. In this way current is balanced via a current mode control approach.

Figure 7.

### Total Current Sense Amplifier

The NCP6153 uses a patented approach to sum the phase currents into a single temperature compensated total current signal. This signal is then used to generate the output voltage droop, total current limit, and the output current monitoring functions. The total current signal is floating with respect to CSREF. The current signal is the difference between CSCOMP and CSREF. The Ref(n) resistors sum the signals from the output side of the inductors to create a low impedance virtual ground. The amplifier actively filters and gains up the voltage applied across the inductors to recover the voltage drop across the inductor series resistance (DCR). Rth is placed near an inductor to sense the temperature of the inductor. This allows the filter time constant and gain to be a function of the Rth NTC resistor and compensate for the change in the DCR with temperature.

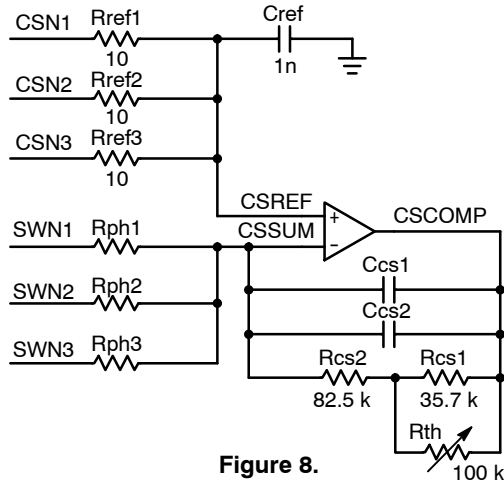

Figure 8.

The DC gain equation for the current sensing:

$$V_{\text{CSCOMP-CSREF}} = - \frac{R_{\text{cs2}} + \frac{R_{\text{cs1}} \cdot R_{\text{th}}}{R_{\text{cs1}} + R_{\text{th}}}}{R_{\text{ph}}} \cdot (I_{\text{out\_Total}} \cdot \text{DCR}) \quad (\text{eq. 2})$$

Set the gain by adjusting the value of the Rph resistors. The DC gain should be set to the output voltage droop. If the voltage from CSCOMP to CSREF is less than 100 mV at ICCMAX then it is recommended to increase the gain of the CSCOMP amp and adding a resistor divider to the Droop pin

filter. This is required to provide a good current signal to offset voltage ratio for the ILIMIT pin. When no droop is needed, the gain of the amplifier should be set to provide ~100 mV across the current limit programming resistor at full load. The values of Rcs1 and Rcs2 are set based on the 100k NTC and the temperature effect of the inductor and should not need to be changed. The NTC should be placed near the closest inductor. The output voltage droop should be set with the droop filter divider.

The pole frequency in the CSCOMP filter should be set equal to the zero from the output inductor. This allows the circuit to recover the inductor DCR voltage drop current signal. Ccs1 and Ccs2 are in parallel to allow for fine tuning of the time constant using commonly available values. It is best to fine tune this filter during transient testing.

$$F_Z = \frac{\text{DCR @ } 25^\circ \text{C}}{2 \cdot \pi \cdot L_{\text{Phase}}} \quad (\text{eq. 3})$$

$$F_P = \frac{1}{2 \cdot \pi \cdot \left( R_{\text{cs2}} + \frac{R_{\text{cs1}} \cdot R_{\text{th}} @ 25^\circ \text{C}}{R_{\text{cs1}} + R_{\text{th}} @ 25^\circ \text{C}} \right) \cdot (C_{\text{cs1}} + C_{\text{cs2}})} \quad (\text{eq. 4})$$

### Programming the Current Limit

The current limit thresholds are programmed with a resistor between the ILIMIT and CSCOMP pins. The ILIMIT pin mirrors the voltage at the CSREF pin and mirrors the sink current internally to IOUT (reduced by the IOUT Current Gain) and the current limit comparators. The 100% current limit trips if the ILIMIT sink current exceeds 10 μA for 50 μs. The 150% current limit trips with minimal delay if the ILIMIT sink current exceeds 15 μA. Set the value of the current limit resistor based on the CSCOMP – CSREF voltage as shown below.

$$R_{\text{LIMIT}} = \frac{\frac{R_{\text{cs2}} + \frac{R_{\text{cs1}} \cdot R_{\text{th}}}{R_{\text{cs1}} + R_{\text{th}}}}{R_{\text{ph}}} \cdot (I_{\text{out\_LIMIT}} \cdot \text{DCR})}{10 \mu} \quad (\text{eq. 5})$$

or

$$R_{\text{LIMIT}} = \frac{V_{\text{CSCOMP-CSREF@ILIMIT}}}{10 \mu} \quad (\text{eq. 6})$$

### Programming DROOP and DAC Feed-Forward Filter

The signals DROOP and CSREF are differentially summed with the output voltage feedback to add precision voltage droop to the output voltage. The total current feedback should be filtered before it is applied to the DROOP pin. This filter impedance provides DAC feed-forward during dynamic VID changes. Programming this filter can be made simpler if CSCOMP–CSREF is equal to the droop voltage. Rdroop sets the gain of the DAC feed-forward and Cdroop provides the time constant to cancel the time constant of the system per the following equations. Cout is the total output capacitance and Rout is the output impedance of the system.

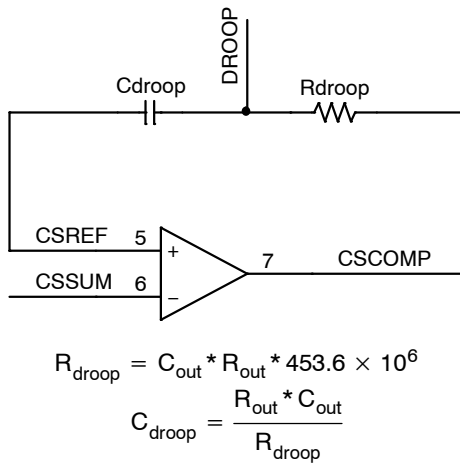

Figure 9.

If the Droop at maximum load is less than 100 mV at ICCMAX we recommend altering this filter into a voltage divider such that a larger signal can be provided to the ILIMIT resistor by increasing the CSCOMP amp gain for better current monitor accuracy. The DROOP pin divider gain should be set to provide a voltage from DROOP to CSREF equal to the amount of voltage droop desired in the output. A current is applied to the DROOP pin during dynamic VID. In this case Rdloop1 in parallel with Rdloop2 should be equal to R<sub>droop</sub>.

Figure 10.

### Programming IOUT

The IOUT pin sources a current in proportion to the ILIMIT sink current. The voltage on the IOUT pin is monitored by the internal A/D converter and should be scaled with an external resistor to ground such that a load equal to ICCMAX generates a 2 V signal on IOUT. A pull-up resistor from 5 V V<sub>CC</sub> can be used to offset the I<sub>OUT</sub> signal positively if needed.

$$R_{IOUT} = \frac{2.0 \text{ V} * R_{LIMIT}}{10 * \frac{R_{cs2} + \frac{R_{cs1} * R_{th}}{R_{ph}}}{R_{ph}} * (I_{out\_ICMAX} * DCR)} \quad (\text{eq. 7})$$

### Programming ICC\_MAX and ICC\_MAXA

The SVID interface provides the platform ICC\_MAX value at register 21h for both the multiphase and the single phase rail. A resistor to ground on the IMAX and IMAXA pins programs these registers at the time the part is enabled. 10 μA is sourced from these pins to generate a voltage on the program resistor. The value of the register is 1 A per LSB and is set by the equation below. The resistor value should be no less than 10 k.

$$ICC\_MAX_{21h} = \frac{R * 10 \mu A * 256 \text{ A}}{2 \text{ V}} \quad (\text{eq. 8})$$

### Programming TSENSE and TSENSEA

Two temperature sense inputs are provided. A precision current is sourced out the output of the TSENSE and TSENSEA pins to generate a voltage on the temperature sense network. The voltages on the temperature sense inputs are sampled by the internal A/D converter. A 100 k NTC similar to the VISHAY ERT-J1VS104JA should be used. Rcomp1 is mainly used for noise. See the specification table for the thermal sensing voltage thresholds and source current.

Figure 11.

### Precision Oscillator

A programmable precision oscillator is provided. The clock oscillator serves as the master clock to the ramp generator circuit. This oscillator is programmed by a resistor to ground on the ROSC pin. The oscillator frequency range is between 200 kHz/phase to 1 MHz/phase. The ROSC pin provides approximately 2 V out and the source current is mirrored into the internal ramp oscillator. The oscillator frequency is approximately proportional to the current flowing in the ROSC resistor.

NCP6153 Operating Frequency versus R<sub>osc</sub>:

$$\frac{10.5 \text{ k}\Omega \times 350 \text{ kHz}}{F_s} = R_{OSC} \quad (\text{eq. 9})$$

The oscillator generates triangle ramps that are 0.5 ~ 2.5 V in amplitude depending on the VRMP pin voltage to provide input voltage feed forward compensation. The ramps are equally spaced out of phase with respect to each other and the signal phase rail is set half way between phases 1 and 2 of the multi phase rail for minimum input ripple current.

#### Programming the Ramp Feed-Forward Circuit

The ramp generator circuit provides the ramp used by the PWM comparators. The ramp generator provides voltage feed-forward control by varying the ramp magnitude with respect to the VRMP pin voltage. The VRMP pin also has a 4 V UVLO function. The VRMP UVLO is only active after the controller is enabled. The VRMP pin is high impedance input when the controller is disabled.

The PWM ramp time is changed according to the following,

$$V_{\text{RAMPpk=pp}} = 0.1 * V_{\text{VRMP}} \quad (\text{eq. 10})$$

Figure 12.

#### Programming TRBST

The TRBST pin provides a signal to offset the output after load release overshoot. This network should be fine tuned during the board tuning process and is only necessary in systems with significant load release overshoot. The TRBST network allows maximum boost for low frequency load release events to minimize load release undershoot. The network time constants are set up to provide a TRBST roll off at higher frequencies where it is not needed.  $C_{\text{boost1}} * R_{\text{bst1}}$  controls the time constant of the load release boost.

This should be set to counter the under shoot after load release.  $R_{\text{bst1}} + R_{\text{bst2}}$  controls the maximum amount of boost during rapid step loading.  $R_{\text{bst2}}$  is generally much larger than  $R_{\text{bst1}}$ . The  $C_{\text{boost2}} * R_{\text{bst2}}$  time constant controls the roll off frequency of the TRBST function.

Figure 13.

#### PWM Comparators

During steady state operation, the duty cycle is centered on the valley of the triangle ramp waveform and both edges of the PWM signal are modulated. During a transient event the duty will increase rapidly and proportionally turning on all phases as the error amp signal increases with respect to the ramps to provide a highly linear and proportional response to the step load.

#### Phase Detection Sequence

During start-up, the number of operational phases and their phase relationship is determined by the internal circuitry monitoring the PWM outputs. Normally, NCP6153 operates as a 4-phase V<sub>CORE</sub>+1-phase V<sub>AUX</sub> PWM controller. For NCP6153, Connecting PWM4 pin to VCC programs 3-phase operation.

The Aux rail can be disabled by pulling the VBOOT<sub>A</sub> signal to VCC. This changes the SVID address scheme to allow the multiphase to be programmed to any SVID Address odd or even. See the register resistor programming table.

## PROTECTION FEATURES

## Input Under Voltage Protection

NCP6153 monitors the 5 V  $V_{CC}$  supply and the VRMP pin for under voltage protection. The gate driver monitors both the gate driver  $V_{CC}$  and the BST voltage (12 V drivers only). When the voltage on the gate driver is insufficient it will pull DRVON low and notify the controller the power is not ready. The gate driver will hold DRVON low for a minimum period of time to allow the controller to restart its startup sequence. In this case the PWM is set back to the MID state and soft start would begin again. See the figure below.

Figure 14. Gate Driver UVLO Restart

## Soft Start

Soft start is implemented internally. A digital counter steps the DAC up from zero to the target voltage based on the predetermined slew rate in the spec table. For NCP6153, the PWM signals will start out open with a test current to collect data on phase count and for setting internal registers. After the configuration data is collected the controller enables and sets the PWM signal to the 2.0 V MID state to indicate that the drivers should be in diode mode. DRVON will then be asserted and the COMP pin released to begin soft-start. The DAC will ramp from Zero to the target DAC codes and the PWM outputs will begin to fire. Each phase will move out of the MID state when the first PWM pulse is produced preventing the discharge of a pre-charged output.

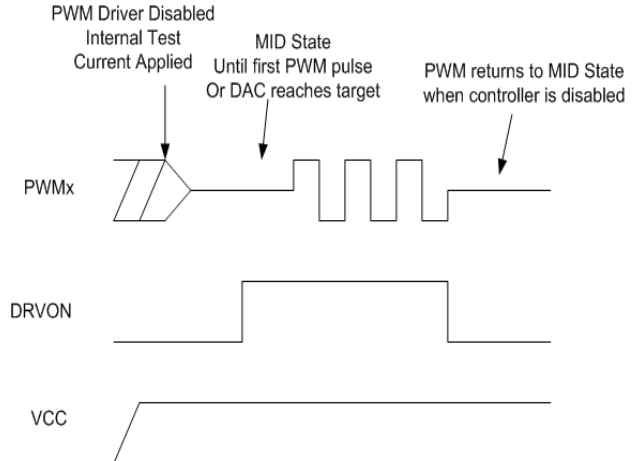

Figure 15. Soft-Start Sequence

## Over Current Latch-Off Protection

During normal operation a programmable total current limit is provided that scales with the phase count during power saving operation. The level of total current limit is set with the resistor from the ILIM pin to CSCOMP. The current through the external resistor connected between ILIM and CSCOMP is then compared to the internal current of 10  $\mu\text{A}$  and 15  $\mu\text{A}$ . If the current into the ILIM pin exceeds the 10  $\mu\text{A}$  level an internal latch-off counter starts. The controller shuts down if the fault is not removed after 50  $\mu\text{s}$ . If the current into the pin exceeds 15  $\mu\text{A}$  the controller will shut down immediately. To recover from an OCP fault the EN pin must be cycled low.

The over-current limit is programmed by a resistor on the ILIM pin. The resistor value can be calculated by the following equation:

$$R_{\text{ILIM}} = \frac{V_{\text{CSCOMP}} - V_{\text{CSREF}}}{10 \mu\text{A}} \quad (\text{eq. 11})$$

### Under Voltage Monitor

The output voltage is monitored at the output of the differential amplifier for UVLO. If the output falls more than 300 mV below the DAC-DROOP voltage the UVLO comparator will trip sending the VR\_RDY signal low.

### Over Voltage Protection

During normal operation the output voltage is monitored at the differential inputs VSP and VSN. If the output voltage exceeds the DAC voltage by approximately 300 mV, PWMs will be forced low until the voltage drops below the OVP threshold. After the first OVP trip the DAC will ramp down to zero to avoid a negative output voltage spike during shutdown. When the DAC gets to zero the PWMs will be forced low and the DRVON will remain high. To reset the part the Enable pin must be cycled low. During soft-start and DVID, the above OVP is disabled. This allows the controller to start up without false triggering the OVP. Meanwhile, there is a second OVP protection which is always enabled. The second OVP monitors CSREF(A) Pin voltage with a protection threshold of 2.3 V.

Figure 16. OVP Threshold Behavior

### Layout Notes

The NCP6153 has differential voltage and current monitoring. This improves signal integrity and reduces noise issues related to layout for easy design use. To insure proper function there are some general rules to follow. Always place the inductor current sense RC filters as close to the CSN and CSP pins on the controller as possible. Place the V<sub>CC</sub> decoupling cap as close as possible to the controller VCC pin, the resistor in series should always be no higher than 2.2 Ω to avoid large voltage drop. The high frequency filter cap on CSREF and the 10 Ω CSREF resistors should be placed close to the controller. The small high feed back cap from COMP to FB should be as close to the controller as possible. Please minimize the capacitance to ground of the FB traces by keeping them short. The filter cap from CSCOMP to CSREF should also be close to the controller.

**Стандарт  
Электрон  
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
