

MAXIM

MAX1522 Evaluation Kit

General Description

The MAX1522 evaluation kit (EV kit) is a fully assembled and tested surface-mount circuit board that contains two separate step-up switching controller circuits. The first circuit (left side) utilizes the MAX1524, is configured for +5V output, and can deliver up to 1A of current. The MAX1524 supply pin is bootstrapped to the output. The second circuit (right side) utilizes the MAX1522, is configured for +12V output, and can deliver up to 200mA of current with the input voltage as low as +2.7V.

The MAX1522 and MAX1524 feature soft-start and fault-detect. The EV kit allows the user to set the on-time of the N-channel MOSFETs to either 0.5 μ s or 3 μ s.

TDK	847-803-6100	847-803-6296
Toshiba	949-455-2000	949-859-3963

Note: Please indicate that you are using the MAX1522, MAX1523, or MAX1524 when contacting these component suppliers.

Features

- ◆ Input Voltage
 - +1.5V to +5.5V (Left Side, BOOTSTRAPPED)
 - +2.5V to +5.5V (Right Side, NON-BOOTSTRAPPED)
- ◆ Output Voltage
 - +5V Output Up to 1A (Left Side)
 - +12V Output Up to 200mA (Right Side)
- ◆ No Current-Sense Resistor
- ◆ Fault-Detection
- ◆ Soft-Start Limits Inrush Current
- ◆ Selectable Maximum Duty Cycle (45% or 80%)
- ◆ Adjustable Output Voltages
- ◆ 1 μ A (max) Shutdown Current
- ◆ Switching Frequency Up to 1MHz
- ◆ Fully Assembled and Tested

Quick Start

The MAX1522 EV kit is fully assembled and tested. Follow these steps to verify board operation. **Do not turn on the power supply until all connections are completed.**

+5.0V Output Circuit (BOOTSTRAPPED)

- 1) Verify that shunts are across pins 2 and 3 of jumper JU1 (SET, 0.5μs) and pins 1 and 2 of jumper JU2 (SHDN).
- 2) Connect a +2.5V to +5.5V DC power supply to the VIN1 pad. Connect the supply ground to the GND1 pad.
- 3) Turn on the power supply.
- 4) With a voltmeter, verify that the output voltage VOUT1 is +5.0V.

For instructions on selecting the feedback resistors for other output voltages, refer to *Evaluating Other Output Voltages* in this document.

+12.0V Output Circuit (NONBOOTSTRAPPED)

- 1) Verify that shunts are across pins 1 and 2 of jumpers JU3 (SET, 3μs) and JU4 (SHDN).
- 2) Connect a +2.5V to +5.5V DC power supply to the VIN2 pad. Connect the supply ground to the GND2 pad.
- 3) Turn on the power supply.
- 4) With a voltmeter, verify that the output voltage VOUT2 is +12V.

For instructions on selecting the feedback resistors for other output voltages, refer to *Evaluating Other Output Voltages* in this document.

Detailed Description

The MAX1522 EV kit is a fully assembled and tested surface-mount circuit board that contains two separate step-up switching controller circuits.

The first circuit (left side), labeled BOOTSTRAPPED, utilizes the MAX1524, is configured for +5.0V output, and can deliver up to 1A of current with 3.3V input voltage. The circuit requires a +1.5V to +5.5V input DC source. The MAX1524 VCC supply is bootstrapped to the output to provide +5V gate drive with low input voltages. The device features a fault-detect that reinitiates soft-start whenever the output drops to half of its nominal voltage regulation level.

The second circuit (right side), labeled NON-BOOTSTRAPPED, utilizes the MAX1522, is configured for +12V output, and can deliver up to 200mA of current with 2.7V input voltage. The circuit requires a +2.5V to +5.5V input DC source. The MAX1522 is not bootstrapped to the output because during regulation the +12.0V exceeds the maximum supply voltage rating of the controller. The MAX1522 features a latched fault-detect that can be reset by toggling the SHDN pin with the jumper provided on the EV kit.

Each circuit requires an input DC source that can supply 2A of current. Both ICs implement soft-start to prevent excessive input currents during startup. The MAX1522 EV kit also provides jumpers to set the fixed on-time of the N-channel MOSFETs. See *Setting the On-Time* section.

Jumper Selection

Shutdown Mode

The MAX1522 EV kit features 3-pin jumpers (JU2 and JU4) to shut down or power up the BOOTSTRAPPED or NON-BOOTSTRAPPED circuits. Table 1 lists the selectable jumper options for jumpers JU2 and JU4.

MAX1522 Evaluation Kit

Evaluates: MAX1522/MAX1523/MAX1524

Table 1. Jumper JU2 and JU4 Functions

SHUNT LOCATION	JUMPER	SHDN PIN	FUNCTION
1 and 2	JU2	Connected to VIN	MAX1524 Enable
	JU4		MAX1522* Enable
2 and 3	JU2	Connected to GND	MAX1524 Disable
	JU4		MAX1522* Disable

*To reset a latched fault-detect condition, the respective IC must be disabled first and then enabled.

Setting the On-Time

The MAX1522 EV kit features 3-pin jumpers (JU1 and JU3) to set the fixed on-time of the N-channel power MOSFET in each circuit. Table 2 lists the selectable jumper options for jumpers JU1 and JU3. Setting the on-time to 3μs ensures an 80% maximum duty factor and a maximum switching frequency of 285kHz. Setting the on-time to 0.5μs ensures a 45% maximum duty factor and a maximum switching frequency of 1MHz.

On the left circuit (BOOTSTRAPPED) of the MAX1522EVKIT, the inductor has been selected for 0.5μs on-time. Before switching the shunt on jumper JU1 from pins 2 and 3 (0.5μs on-time) to pins 1 and 2 (3.0μs on-time), it is necessary to change inductor L1 to a higher value and a higher saturation current rating to prevent inductor saturation. Refer to the *Design Procedure* section of the MAX1522 data sheet for details.

On the right circuit (NON-BOOTSTRAPPED) of the MAX1522EVKIT, the inductor and the output voltage setting have been selected for 3.0μs on-time. Switching the shunt on jumper JU3 from pins 1 and 2 (3.0μs on-time) to pins 2 and 3 (0.5μs on-time) will prevent the output voltage from reaching 12V under load. Refer to the *Design Procedure* section of the MAX1522 data sheet for details.

Table 2. Jumper JU1 and JU3 Functions

SHUNT LOCATION	SET PIN	FUNCTION
1 and 2	Connected to VCC	3.0μs On-Time
2 and 3	Connected to GND	0.5μs On-Time

Evaluating Other Output Voltages

Left Circuit (+5V)

The EV kit contains a MAX1524 step-up controller on the left side of the board (BOOTSTRAPPED) that is set for +5V (VOUT1) output by two feedback resistors. To

generate output voltages other than +5V (+2.5V to +5.5V), replace resistors R1 and R2. Refer to the *Component List* to verify that the circuit's components will function properly if the output voltage is reconfigured. The output voltages are determined by the following equation:

$$VOUT1 = V_{FB}((R1 / R2) + 1)$$

where $V_{FB} = 1.25V$.

Right Circuit (+12V)

The MAX1522 EV kit contains a MAX1522 step-up controller on the right side of the board (NONBOOTSTRAPPED) that is set for +12V (VOUT2) output by two feedback resistors. To generate output voltages other than +12.0V, replace resistors R3 and R4. Refer to the *Component List* to verify that the circuit's components will function properly if the output voltage is reconfigured. The output voltages are determined by the following equation:

$$VOUT2 = V_{FB}((R3 / R4) + 1)$$

where $V_{FB} = 1.25V$.

Evaluating the MAX1523

The MAX1522 EV kit can also evaluate the MAX1523 step-up controller. The MAX1523 is different from the MAX1522 in that it doesn't latch a fault-detect. To evaluate the MAX1523, replace the MAX1522, located on the right circuit (NON-BOOTSTRAPPED), with the MAX1523. To request MAX1523 samples, call the phone number listed at the bottom of page 1 of this data sheet and ask for MAX1523EUT samples.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
