Ripple & noise are measured at 20MHz of bandwidth by using a 12" twisted pair-wire terminated with a 0.1uf & 47uf parallel capacitor. Derating may be needed under low input voltages. Please check the static characteristics for more details. Please refer to "DRIVING METHODS OF LED MODULE". The power supply is considered as a component that will be operated in combination with final equipment. Since EMC performance will be affected by the complete installation, the final equipment manufacturers must re-qualify EMC Directive on the complete installation again. Refer to warranty statement. ELG-150-C1750 and ELG-150-C2100 will be announced shortly.

EFFICIENCY vs LOAD (500mA Model)

ELG-150-C series possess superior working efficiency that up to 92% can be reached in field applications.

DRIVING METHODS OF LED MODULE

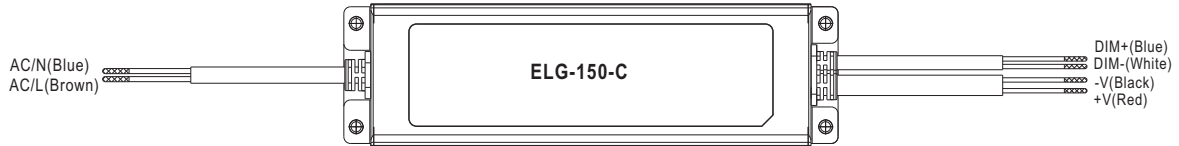

This LED power supply is suggested to work in constant current mode area (CC) to drive the LEDs.

Typical LED power supply I-V curve

In the constant current region, the highest voltage at the output of the driver depends on the configuration of the end systems.
Should there be any compatibility issues, please contact MEAN WELL.
