

# Low Power Video Difference Amplifier

## FEATURES

- Differential or Single-Ended Gain Block (Adjustable)
- $-3\text{dB}$  Bandwidth,  $A_V = \pm 10$       35MHz
- Slew Rate      220V/ $\mu\text{s}$
- Low Supply Current      13mA
- Output Current       $\pm 20\text{mA}$
- CMRR at 10MHz      48dB
- LT1193 Pin Out
- Low Cost
- Single 5V Operation
- Drives Cables Directly
- Output Shutdown

## APPLICATIONS

- Line Receivers
- Video Signal Processing
- Cable Drivers
- Tape and Disc Drive Systems

## DESCRIPTION

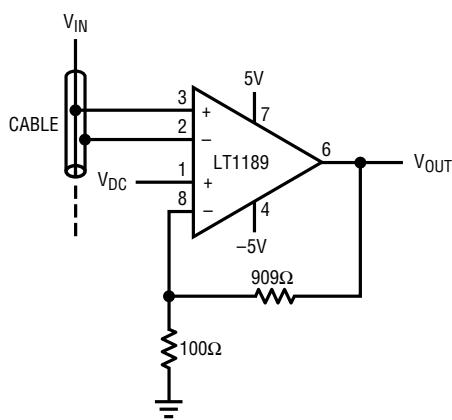

The LT1189 is a difference amplifier optimized for operation on  $\pm 5\text{V}$ , or a single 5V supply, and gain  $\geq 10$ . This versatile amplifier features uncommitted high input impedance (+) and (-) inputs, and can be used in differential or single-ended configurations. Additionally, a second set of inputs give gain adjustment and DC control to the difference amplifier.

The LT1189's high slew rate, 220V/ $\mu\text{s}$ , wide bandwidth, 35MHz, and  $\pm 20\text{mA}$  output current require only 13mA of supply current. The shutdown feature reduces the power dissipation to a mere 15mW, and allows multiple amplifiers to drive the same cable.

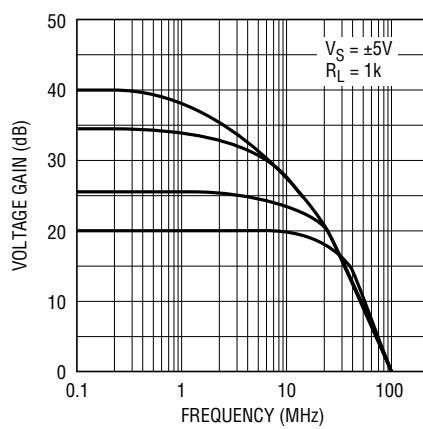

The LT1189 is a low power, gain of 10 stable version of the popular LT1193, and is available in 8-pin miniDIPs and SO packages. For lower gain applications see the LT1187 data sheet.

## TYPICAL APPLICATION

Cable Sense Amplifier for Loop Through Connections with DC Adjust

**Note 1:** A heat sink may be required to keep the junction temperature below absolute maximum when the output is shorted continuously.

**Note 2:**  $T_J$  is calculated from the ambient temperature  $T_A$  and power dissipation  $P_D$  according to the following formulas:

$$\text{LT1189MJ8, LT1189CJ8: } T_J = T_A + (P_D \times 100^{\circ}\text{C/W})$$

$$\text{LT1189CN8: } T_J = T_A + (P_D \times 100^{\circ}\text{C/W})$$

$$\text{LT1189CS8: } T_J = T_A + (P_D \times 150^{\circ}\text{C/W})$$

**Note 3:** When  $R_L = 1\text{k}$  is specified, the load resistor is  $R_{\text{FB1}} + R_{\text{FB2}}$ , but when  $R_L = 300\Omega$  is specified, then an additional  $430\Omega$  is added to the output such that  $(R_{\text{FB1}} + R_{\text{FB2}})$  in parallel with  $430\Omega$  is  $R_L = 300\Omega$ .

**Note 4:**  $V_{\text{OS}}$  measured at the output (pin 6) is the contribution from both input pair, and is input referred.

**Note 5:**  $V_{\text{IN LIM}}$  is the maximum voltage between  $-V_{\text{IN}}$  and  $+V_{\text{IN}}$  (pin 2 and pin 3) for which the output can respond.

**Note 6:** Slew rate is measured between  $\pm 1\text{V}$  on the output, with a  $V_{\text{IN}}$  step of  $\pm 0.5\text{V}$ ,  $A_V = 10$  and  $R_L = 1\text{k}$ .

**Note 7:** Full power bandwidth is calculated from the slew rate measurement:  $\text{FPBW} = \text{SR}/2\pi V_p$ .

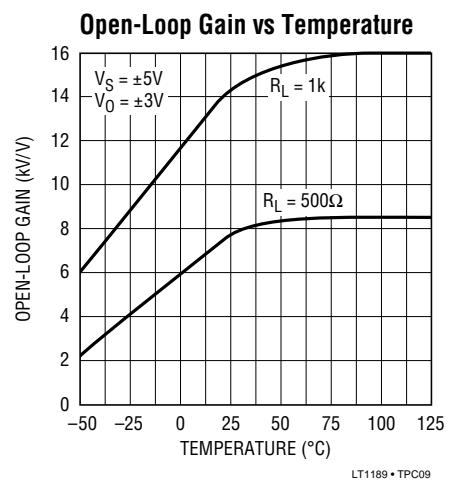

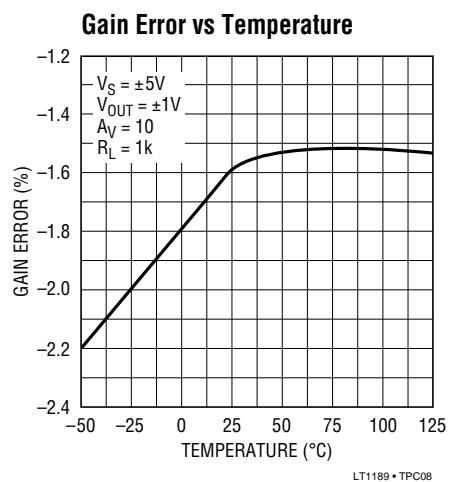

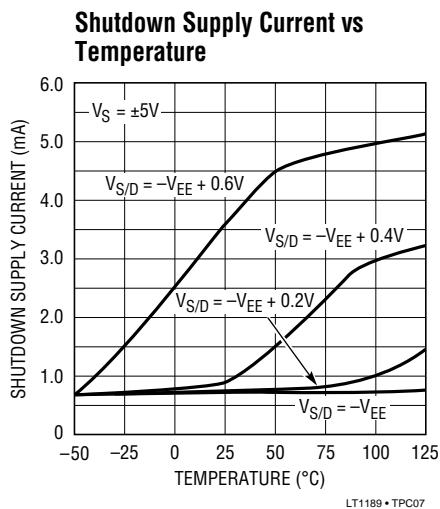

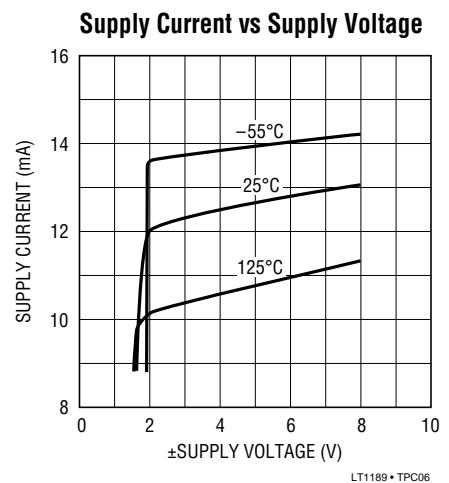

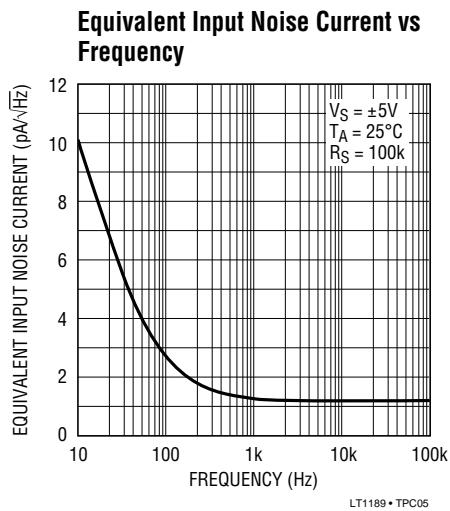

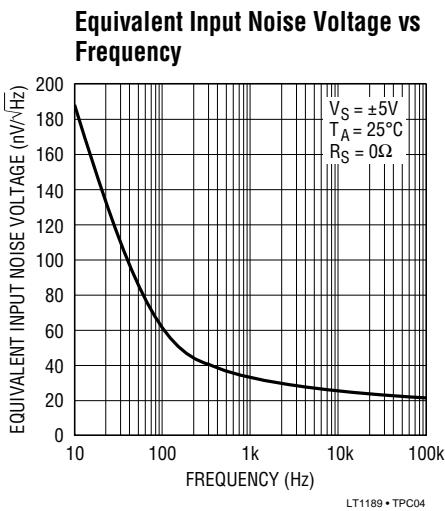

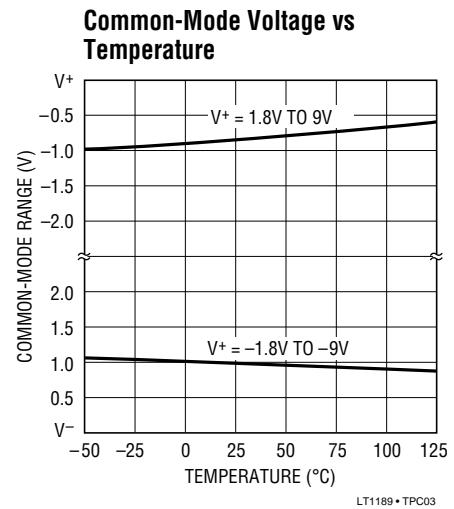

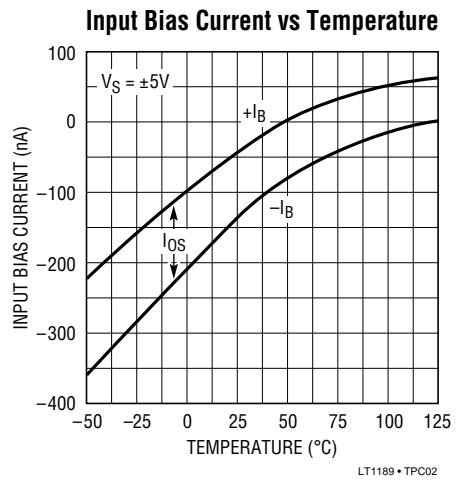

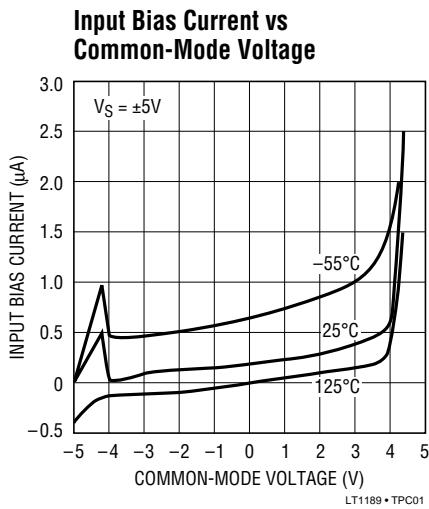

**Note 8:** Settling time measurement techniques are shown in "Take the Guesswork Out of Settling Time Measurements," EDN, September 19, 1985.

**Note 9:** NTSC (3.58MHz).

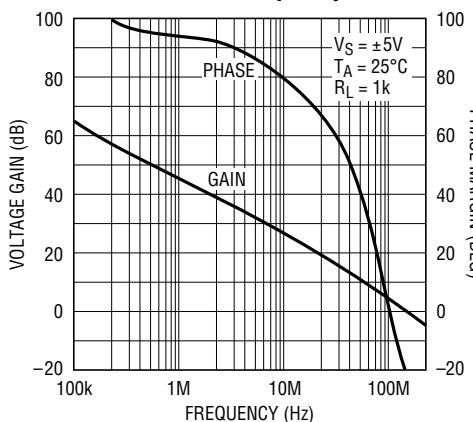

**Note 10:** AC parameters are 100% tested on the ceramic and plastic DIP packaged parts (J8 and N8 suffix) and are sample tested on every lot of the SO packaged parts (S8 suffix).

**Note 11:** See Application section for shutdown at elevated temperatures. Do not operate shutdown above  $T_J > 125^{\circ}\text{C}$ .

## APPLICATIONS INFORMATION

The primary use of the LT1189 is in converting high speed differential signals to a single-ended output. The LT1189 video difference amplifier has two uncommitted high input impedance (+) and (-) inputs. The amplifier has another set of inputs which can be used for reference and feedback. Additionally, this set of inputs give gain adjust, and DC control to the differential amplifier. The voltage gain of the LT1189 is set like a conventional operational amplifier. Feedback is applied to pin 8, and it is optimized for gains of 10 or greater. The amplifier can be operated single-ended by connecting either the (+) or (-) inputs to the +/REF (pin 1). The voltage gain is set by the resistors:  $(R_{FB} + R_G)/R_G$ .

Like the single-ended case, the differential voltage gain is set by the external resistors:  $(R_{FB} + R_G)/R_G$ . The maximum input differential signal for which the output will respond is approximately  $\pm 170\text{mV}$ .

### Power Supply Bypassing

The LT1189 is quite tolerant of power supply bypassing. In some applications a  $0.1\mu\text{F}$  ceramic disc capacitor placed 1/2 inch from the amplifier is all that is required. In applications requiring good settling time, it is important to use multiple bypass capacitors. A  $0.1\mu\text{F}$  ceramic disc in parallel with a  $4.7\mu\text{F}$  tantalum is recommended.

### Calculating the Output Offset Voltage

Both input stages contribute to the output offset voltage at pin 6. The feedback correction forces balance in the input stages by introducing an Input  $V_{OS}$  at pin 8. The complete expression for the output offset voltage is:

$$V_{OUT} = (V_{OS} + I_{OS}(R_S) + I_B(R_{REF})) \times (R_{FB} + R_G)/R_G + I_B(R_{FB})$$

$R_S$  represents the input source resistance, typically  $75\Omega$ , and  $R_{REF}$  represents finite source impedance from the DC reference voltage, for  $V_{REF}$  grounded,  $R_{REF} = 0\Omega$  the  $I_{OS}$  is normally a small contributor and the expression simplifies to:

$$V_{OUT} = V_{OS}(R_{FB} + R_G)/R_G + I_B(R_{FB})$$

If  $R_{FB}$  is limited to 1k, the last term of the equation contributes only 2mV since  $I_B$  is less than  $2\mu\text{A}$ .

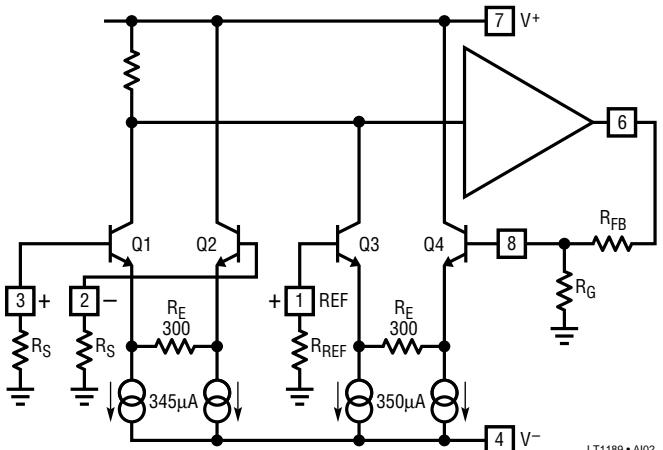

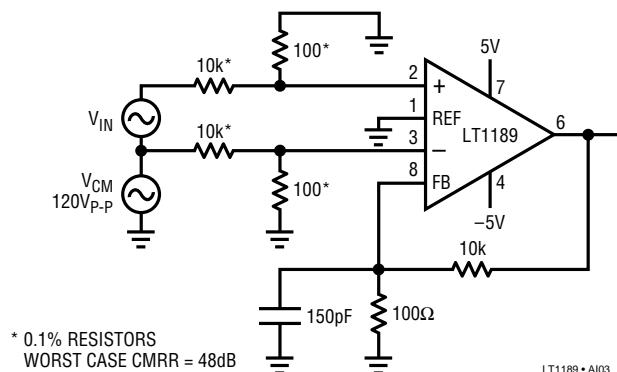

Figure 1. Simplified Input Stage Schematic

## APPLICATIONS INFORMATION

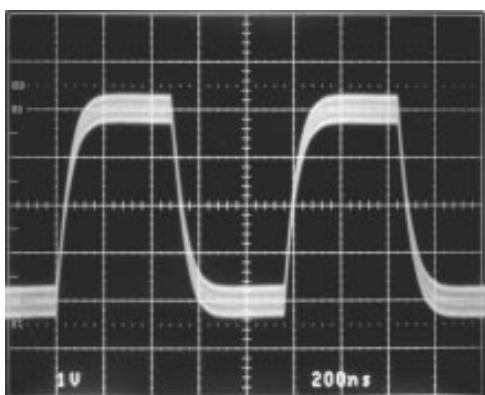

### Instrumentation Amplifier Rejects High Voltage

Instrumentation amplifiers are often used to process slowly varying outputs from transducers. With the LT1189 it is easy to make an instrumentation amplifier that can respond to rapidly varying signals. Attenuation resistors in front of the LT1189 allow very large common-mode signals to be rejected while maintaining good frequency response. The input common-mode and differential-mode signals are reduced by 100:1, while the closed-loop gain is set to be 100, thereby maintaining unity-gain input to output. The unique topology allows for frequency response boost by adding 150pF to pin 8 as shown.

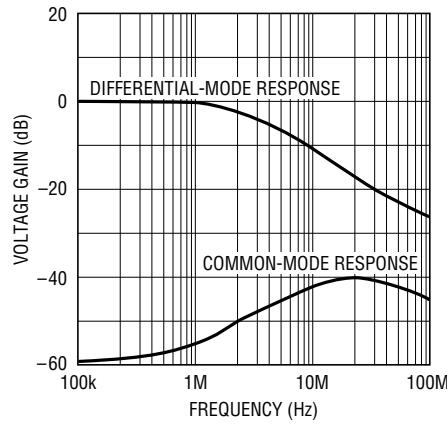

### 3.5MHz Instrumentation Amplifier Rejects 120V<sub>P-P</sub>

### Output of Instrumentation Amplifier with 1MHz Square Wave Riding on 120V<sub>P-P</sub> at the Input

### High Voltage Instrumentation Amplifier Response

### Operating with Low Closed-Loop Gain

The LT1189 has been optimized for closed-loop gains of 10 or greater. The amplifier can be operated at much lower closed-loop gains with the aid of a capacitor  $C_{FB}$  across the feedback resistor, (feedback zero). This capacitor lowers the closed-loop 3dB bandwidth. The bandwidth cannot be made arbitrarily low because  $C_{FB}$  is a short at high frequency and the amplifier will appear configured unity-gain. As an approximate guideline, make  $BW \times A_{VCL} = 200\text{MHz}$ . This expression expands to:

$$\frac{A_{VCL}}{2\pi(R_{FB})(C_{FB})} = 200\text{MHz}$$

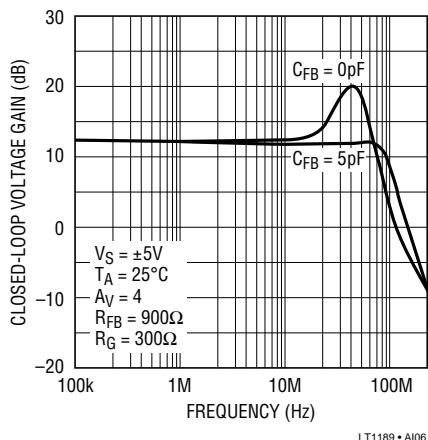

or:

$$C_{FB} = \frac{A_{VCL}}{(200\text{MHz})(2\pi)(R_{FB})}$$

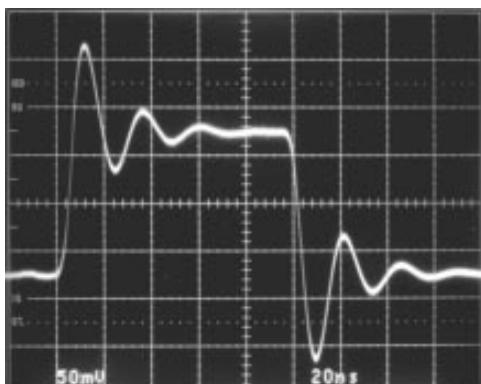

The effect of the feedback zero on the transient and frequency response is shown for  $A_V = 4$ .

## APPLICATIONS INFORMATION

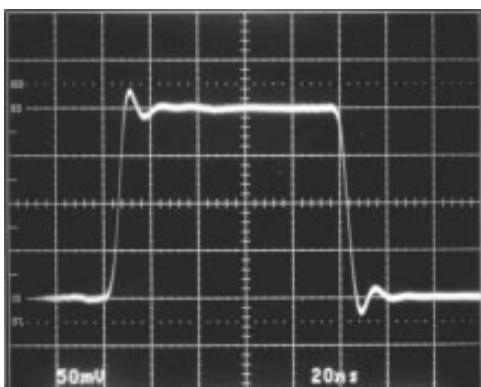

## Closed-Loop Voltage Gain vs Frequency

## Small-Signal Transient Response

 $A_V = 4, R_{FB} = 910\Omega, R_G = 300\Omega$ 

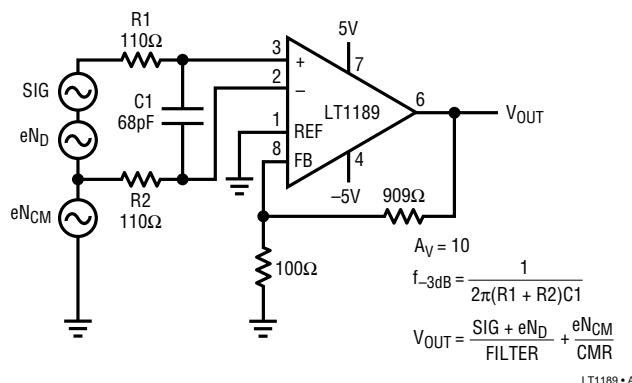

## Small-Signal Transient Response

 $A_V = 4, R_{FB} = 910\Omega, R_G = 300\Omega, C_{FB} = 5pF$ 

## Reducing the Closed-Loop Bandwidth

Although it is possible to reduce the closed-loop bandwidth by using a feedback zero, instability can occur if the bandwidth is made too low. An alternate technique is to do differential filtering at the input of the amplifier. This technique filters the differential input signal, and the differential noise, but does not filter common-mode noise. Common-mode noise is rejected by the LT1189's CMRR.

## 10MHz Bandwidth Limited Amplifier

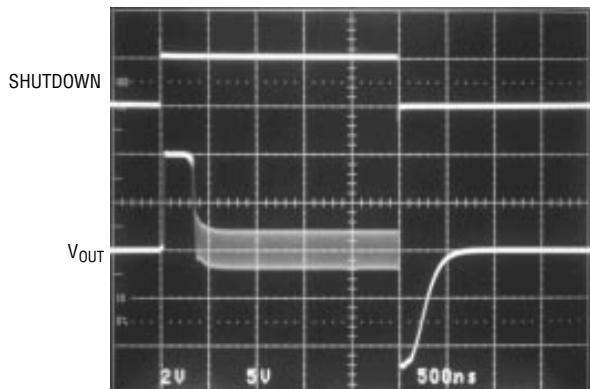

## Using the Shutdown Feature

The LT1189 has a unique feature that allows the amplifier to be shutdown for conserving power, or for multiplexing several amplifiers onto a common cable. The amplifier will shutdown by taking pin 5 to  $V^-$ . In shutdown, the amplifier dissipates 15mW while maintaining a true high impedance output state of about  $20k\Omega$  in parallel with the feedback resistors. For MUX applications, the amplifiers may be configured inverting, non-inverting, or differential. When the output is loaded with as little as  $1k\Omega$  from the amplifier's feedback resistors, the amplifier shuts off in 600ns. This shutoff can be under the control of HC CMOS operating between 0V and  $-5V$ .

## APPLICATIONS INFORMATION

### 1MHz Sine Wave Gated Off with Shutdown Pin

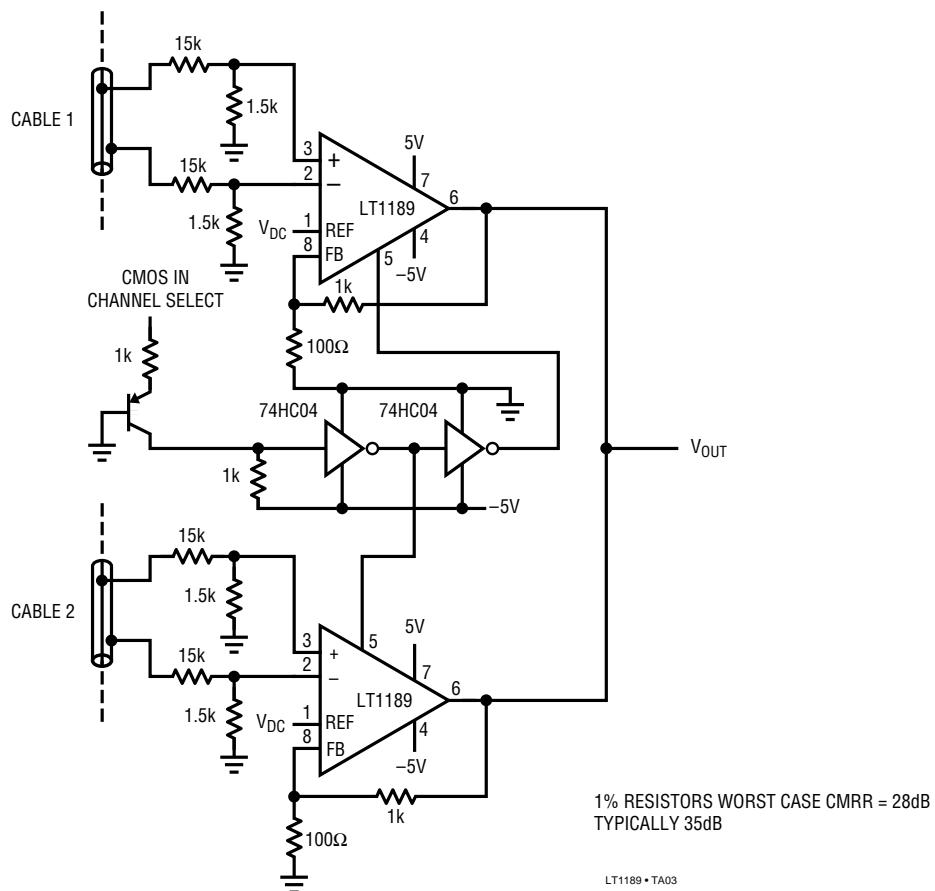

LT1189 • AI10

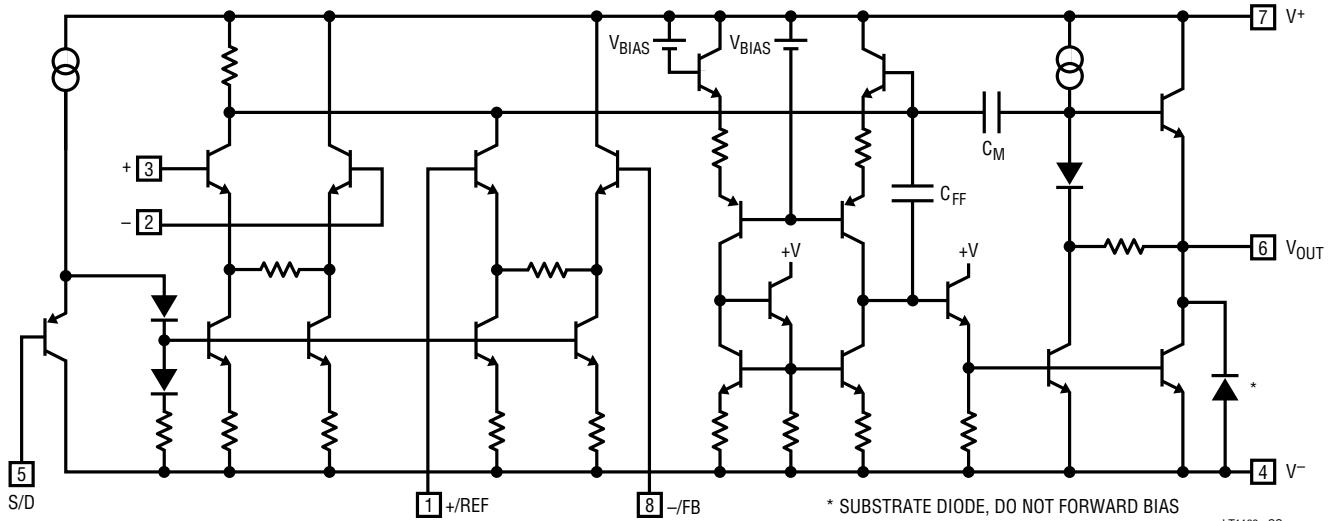

The ability to maintain shutoff is shown on the curve Shut down Supply Current vs Temperature in the Typical Performance Characteristics section. At very high elevated temperature it is important to hold the shutdown pin close to the negative supply to keep the supply current from increasing.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
