

# MIC2786/MIC2787

## Push-Button Reset IC with Voltage Supervisor

### General Description

The MIC2786/MIC2787 are low-current, ultra-small, push-button supervisor reset ICs with an integrated supply voltage monitor. The device features two manual reset inputs and two reset outputs. The reset outputs are asserted and held when the supply voltage decreases below the factory programmed threshold voltage. Reset will be asserted for the reset timeout delay once the supply voltage increases above the rising threshold voltage or when both manual reset inputs are asserted low for longer than the setup delay time.

The MIC2786 features integrated pull-up resistors on the /MR0 and /MR1 inputs, while the MIC2787 requires external pull-up resistors. The PDY input pin selects between a 2s, 4s or 6s setup period. Factory-programmed reset timeout delays of 140ms (min.) and 240ms (min.) are available. An active-low, open-drain reset output (/RST) and an active-high, push-pull reset output (RSTP) provide flexibility when interfacing to various microcontrollers, PMICs, or load switches.

The MIC2786/MIC2787 consume a quiescent current of only 7.4µA and are offered in a tiny, space saving 8-pin Thin MLF® (2mm x 2mm x 0.55mm) package.

Data sheets and support documentation can be found on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

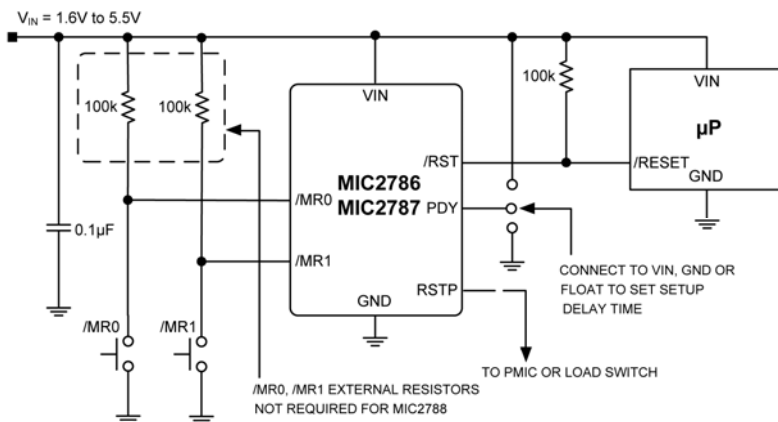

### Features

- 1.6V to 5.5V operating voltage
- 7.4µA supply current when /MR0, /MR1 not asserted
- 1.66V to 4.63V preset voltage threshold options
- 2.5% voltage threshold accuracy over temperature
- Asserting /MR0 and /MR1 for the setup delay time asserts reset output for the reset timeout delay
- Programmable delay (PDY) input selects 2s, 4s or 6s setup delay
- Factory-programmed 140ms (min.) or 240ms (min.) reset timeout delay
- Integrated /MR0, /MR1 pull-up resistors (MIC2786)
- Dual reset outputs:
  - Open-drain, active-low reset output (/RST)
  - Push-pull, active-high reset output (RSTP)
- -40°C to +85°C ambient operating temperature range
- 8-pin 2mm x 2mm x 0.55mm Thin MLF® package

### Applications

- Smart phones
- Tablets
- Set-top boxes (STB)

### Typical Application

MLF and MicroLeadFrame are registered trademarks of Amkor Technologies, Inc.

### Notes:

1. All devices available in Tape and Reel only.
2. Contact Factory for availability.
3. Thin MLF<sup>®</sup> ▲ = Pin 1 identifier.
4. Thin MLF<sup>®</sup> is a Green RoHS-compliant package. Lead finish is NiPdAu. Mold compound is Halogen Free.

## Pin Configuration

**MIC2786/MIC2787**  
**8-Pin (2mm × 2mm) Thin MLF®**  
**Top View**

## Pin Description

Pin Number	Pin Name	Pin Function
1	RSTP	Active-High Push-Pull Reset Output. This output changes from low-to-high when VIN drops below the selected reset threshold or both manual reset pins are pulled low for the setup delay period. RSTP remains high for the reset timeout delay after VIN exceeds the reset threshold plus hysteresis voltage or the setup delay period has elapsed.
2	GND	Supply Ground.
3	/MR1	Active-Low Manual Reset Input. The MIC2786 has an internal 65kΩ pull-up resistor to VIN, while the MIC2787 requires an external pull-up resistor to VIN if used with a push button. Pull this pin low to assert and force a reset. Pulling both manual reset inputs low for the setup delay time causes one reset output pulse for the reset timeout delay period. Connect to VIN if unused, do not leave floating.
4	/RST	Active-Low Open-Drain Reset Output. This output changes from high-to-low when VIN drops below the selected reset threshold or both manual reset pins are pulled low for the setup delay period. /RST remains low for the reset timeout delay after VIN exceeds the reset threshold or the setup delay has elapsed and it requires an external pull-up resistor.
5	PDY	Programmable Delay Input with Tri-State Connection. When left open, setup delay is 2s, when connected to GND, setup delay is 4s and when connected to VIN, setup delay is 6s.
6	NC	No Connect. Leave pin floating.
7	/MR0	Active Low Manual Reset Input. The MIC2786 has an internal 65kΩ pull-up resistor to VIN, while the MIC2787 requires an external pull-up resistor to VIN if used with a push button. Pull this pin low to assert and force a reset. Pulling both manual reset inputs low for the setup delay time causes one reset output pulse for the reset timeout delay period. If unused, connect to VIN; do not leave floating.
8	VIN	Supply Voltage Pin. It is the input to the Supply Voltage monitor. When the supply voltage falls below the reset threshold voltage, reset outputs (/RST and RSTP) are triggered immediately. When the supply voltage rises above the reset threshold plus hysteresis voltage, the reset outputs remain asserted for the duration of the reset timeout delay. A minimum 0.1μF decoupling ceramic capacitor must be connected between VIN and GND close to the pins.
EPAD	EPAD	Exposed Pad. Connect to GND.

**Absolute Maximum Ratings<sup>(1)</sup>**

Supply Voltage ( $V_{IN}$ )	-0.3V to +6.0V
Reset Input Voltage (/MR0, /MR1)	-0.3V to $V_{IN}+0.3V$
Open Drain Reset Output (/RST)	-0.3V to +6.0V

### Notes:

- Exceeding the absolute maximum rating may damage the device.
- The device is not guaranteed to function outside its operating rating.
- Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5k $\Omega$  in series with 100pF.
- Specification for packaged product only.

## Application Information

### Design and Product Advantages

The MIC2786/MIC2787 are voltage supervisor reset ICs with dual manual reset inputs and long manual reset setup delay times. The dual manual reset inputs and long manual reset setup delay times help protect against accidental system resets in applications such as smart phones, personal navigation devices, MP3 players, and set-top boxes (STB).

The MIC2786/MIC2787 assert and hold a reset when the supply voltage decreases below the factory-programmed threshold voltage. Reset is asserted for a fixed reset timeout delay once the supply voltage increases above the rising threshold voltage or when both manual reset inputs are asserted low for longer than the setup delay time.

The MIC2786/MIC2787 feature manual reset setup delay times of 2s, 4s or 6s, which are selected by the tri-state programmable delay input pin (PDY). They are available with factory-programmed reset timeout delays of 140ms (min.) or 240ms (min.). Both the MIC2786 and MIC2787 feature an active-low, open-drain reset output (/RST) and an active-high, push-pull reset output (RSTP). This allows flexibility for interfacing with different microprocessors, PMICs, and load-switches. The MIC2786 features 65k $\Omega$  pull-up resistors on the /MR0 and /MR1 inputs to provide ease when connecting to push-button inputs. The MIC2787 does not provide pull-up resistors on the manual reset inputs and is intended for directly interfacing to logic outputs.

### Supply Bypass Capacitor

A 0.1 $\mu$ F input bypass capacitor must be placed from  $V_{IN}$  (Pin 8) to GND (Pin 2).

### Programmable Delay Input (PDY)

The MIC2786/MIC2787 has a programmable setup delay time,  $t_{SETUP}$  that is set via a tri-state logic configuration. The PDY pin is intended to be connected to the  $V_{IN}$  supply voltage, ground or left floating.

PDY Configuration	$t_{SETUP}$
OPEN	2s
GND	4s
$V_{IN}$	6s

### Dual Manual Reset Inputs (/MR0, /MR1)

The /MR0, /MR1 input pins have integrated pull-up resistors for the MIC2786 but require external pull-up resistors for the MIC2787. A recommended value is 100k $\Omega$  to keep the current consumption low when the push-button switches are pressed. The behavior of the reset outputs is independent of the order in which the /MR0, /MR1 inputs are driven low. If both inputs are low for a setup delay time, only one reset pulse, of width  $t_{RESET}$ , is generated. Keeping both inputs low for a longer time does not generate additional reset output pulses.

### Reset Outputs (/RST and RSTP)

The /RST output is a simple open-drain N-channel MOSFET structure that requires a pull-up resistor to an external voltage. For most applications, the pull-up voltage will be the same as the power supply that supplies  $V_{IN}$  to the MIC2786/MIC2787. As shown in Figure 1, it is possible to tie this resistor to some other voltage, other than  $V_{IN}$ , thus enabling level-shifting of the /RST output. The pull-up voltage must be limited to 5.5V or less to avoid damage to the MIC2786/MIC2787. The pull-up resistor must be small enough to supply current to the inputs and leakage paths that are driven by the /RST output (a recommended value is 100k $\Omega$ ). Leave floating if the /RST pin is unused.

Since the /RST output is open-drain, several reset sources can be wire-ORed, in parallel, to allow resets from multiple sources. By tying the pull-up resistor to some other voltage, the MIC2786/MIC2787 can monitor one voltage while level-shifting the /RST output to some other voltage.

The RSTP pin is a push-pull output that is driven to  $V_{IN}$ . It cannot be level-shifted to another voltage. It is an inverted signal of /RST.

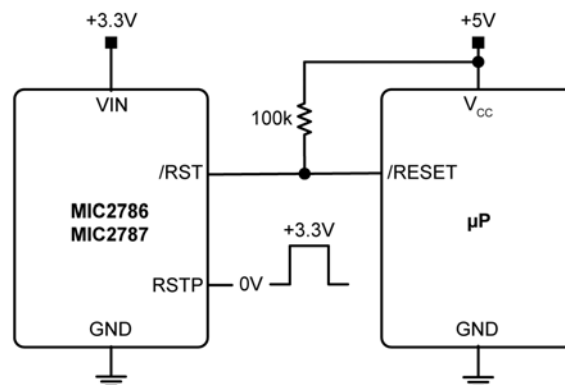

Figure 1. MIC2786/MIC2787 Used in Multiple Supply System

**Asserting /RST and RSTP Outputs**

**a) When Functioning as a Manual Reset**

The reset outputs /RST and RSTP are asserted when the setup delay time,  $t_{SETUP}$ , is exceeded while the /MR0, /MR1 pins are driven low. Both the reset outputs remain asserted for a factory-programmed reset timeout delay time  $t_{RESET}$ . Two options are available with 140ms or 240ms minimum  $t_{RESET}$  duration. The /RST pin is driven active low while the RSTP pin is driven active high for the  $t_{RESET}$  duration. The reset outputs are undefined for  $V_{IN} < 1.6V$ .

**Figure 2. Manual Reset Function**

**b) When Functioning as a Voltage Monitor**

The /RST pin is asserted whenever  $V_{IN}$  falls below the reset threshold voltage,  $V_{TH}$  ( $V_{IN} < V_{TH}$ ). The  $V_{IN}$  pin circuitry includes hysteresis to prevent /RST or RSTP pin chattering due to noise. The /RST pin remains asserted for the duration of the reset timeout delay ( $t_{RESET}$ ) after  $V_{IN}$  has risen above the reset threshold voltage plus the hysteresis. The reset function ensures a microprocessor is properly reset and powers up in a known condition after a power failure. /RST remains valid with  $V_{IN}$  as low as 1.6V. The RSTP output is a compliment of the /RST output.

**Figure 3. Voltage Monitor Function**

**$V_{IN}$  Transients**

The MIC2786/MIC2787 is relatively immune to small negative-going  $V_{IN}$  glitches below the reset threshold. As shown in Figure 4, the overdrive voltage is the difference between the threshold voltage and the minimum point of the  $V_{IN}$  glitch. Typically, an overdrive of 100mV, with duration of 20 $\mu$ s or less will not cause a reset.

**Figure 4.  $V_{IN}$  Transient**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
