TYPICAL RESPONSE IN HUMIDITY

- Polynomial response of HTS2030SMD:

$$C \text{ (pF)} = C@55 \% (3.903 \cdot 10^{-8} \cdot RH^3 - 8.294 \cdot 10^{-6} \cdot RH^2 + 2.188 \cdot 10^{-3} \cdot RH + 0.898)$$

TYPICAL TEMPERATURE OUTPUT

Depending on the needed temperature measurement range and associated accuracy, we suggest two methods to access to the NTC resistance values.

①

$$R_T = R_N \cdot e^{B \left(\frac{1}{T} - \frac{1}{T_N} \right)}$$

R_T NTC resistance in Ω at temperature T in K

R_N NTC resistance in Ω at rated temperature in K

T, T_N Temperature in K

B B value, material-specific constant of the NTC thermistor

e Base of natural logarithm ($e = 2.71828$)

The actual characteristic of an NTC thermistor can, however, only be roughly described by the exponential relation, as the material parameter B in reality also depends on temperature. So this approach is only suitable for describing a restricted range around the rated temperature or resistance with sufficient accuracy.

②

For practical applications a more precise description of the real R/T curve may be required. Either more complicated approaches (e.g. the Steinhart-Hart equation) are used or the resistance/temperature relation as given in tabulated form. The below table has been experimentally determined with utmost accuracy for temperature increments of 1 degree.
