## **UBA2030T** Full bridge driver IC

Product specification  
Supersedes data of 1999 Aug 10

2002 Sep 27

## Full bridge driver IC

## UBA2030T

### FEATURES

- Full bridge driver
- Integrated bootstrap diodes
- Integrated high voltage level shift function
- High voltage input (570 V maximum) for the internal supply
- Adjustable 'dead time'
- Adjustable oscillator frequency
- High voltage level shifter for the bridge enable function
- Shut-down function.

### GENERAL DESCRIPTION

The UBA2030T is a high voltage integrated circuit fabricated using the BCD750 power logic process. The circuit is designed for driving the MOSFETs in a full bridge configuration. In addition, it features a shut-down function, an adjustable oscillator and a PMOS high voltage level shifter to control the bridge enable function. To guarantee an accurate 50% duty factor, the oscillator signal passes through a divider before being fed to the output drivers.

### APPLICATIONS

- The UBA2030T can drive the MOSFETs in any type of load configured as a full bridge
- The circuit is intended as a commutator for High Intensity Discharge (HID) lamps.

### ORDERING INFORMATION

## Full bridge driver IC

## UBA2030T

### FUNCTIONAL DESCRIPTION

#### Supply voltage

The UBA2030T is powered by a single supply voltage connected to the HV pin (the full bridge supply could be used, for example). The IC generates its own low voltage supply for driving the internal circuitry and the MOSFETs in the full bridge, removing the need for an additional low voltage supply. A capacitor must be connected between the V<sub>DD</sub> pin and SGND to obtain a ripple-free internal supply voltage.

#### Start-up

When the power is turned on, the UBA2030T enters a start-up phase; the high side MOSFETs are switched off and the low side MOSFETs switched on. During start-up, the bootstrap capacitors are charged and the bridge output current is zero.

#### Oscillation

At the point where the supply voltage at the HV pin crosses the 'start oscillating threshold', the bridge begins commutating between the following two defined states:

- Higher left and lower right MOSFETs on and higher right and lower left MOSFETs off
- Higher left and lower right MOSFETs off and higher right and lower left MOSFETs on.

When the internal oscillator is used, the bridge commutating frequency is determined by the values of an external resistor and capacitor. In this mode, the EXO pin must be connected to SGND.

When an external oscillator is used, its output must be connected to the EXO pin; the internal oscillator must be disabled by connecting the RC pin to SGND. The bridge commutating frequency is half the oscillator frequency due to a  $\pm 2$  circuit which guarantees an accurate 50% duty factor.

The time between turning off the conducting pair of MOSFETs and turning on the other pair, the 'dead time', can be adjusted using an external resistor. If the supply voltage at the HV pin falls below the 'stop oscillating threshold', the UBA2030T re-enters the start-up phase.

#### Bridge enable

The bridge enable function allows the bridge to be held in its current state. When active, it connects the RC pin to SGND, disabling the internal oscillator. If the bridge enable function is activated during 'dead time', the bridge is allowed to enter the next conducting state before being held. Oscillations resume the instant the bridge enable function is turned off. A timing diagram is shown in Fig.3.

To hold the bridge, an external control circuit is required to provide a source current to the bridge enable control input (pin BE), and to supply a reference voltage to pin BER (see Fig.6).

#### Shut-down

The active HIGH shut-down input (pin SD) can be used at any time to turn off all four MOSFETs. However, if the supply voltage drops below the 'stop oscillating threshold', the bridge re-enters the start-up phase even if the shut-down function is active.

## UBA2030T

**LIMITING VALUES**

In accordance with the Absolute Maximum Rating System (IEC 60134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
$V_{DD}$	supply voltage (low voltage)		0	18	V
$V_{HV}$	supply voltage (high voltage)	note 1	0	570	V
$V_{FSL}, V_{FSR}$	floating supply voltage	$V_{SHL} = V_{SHR} = 570$ V, note 1	570	588	V
		$V_{SHL} = V_{SHR} = 0$ V	0	18	V
$V_{SHL}, V_{SHR}$	source voltage for higher right and left MOSFETs	with reference to PGND and SGND	-10	+570	V
$V_{PGND}$	power ground voltage	with reference to SGND	-7	+10	V
$V_{i(BER)}$	bridge enable reference input voltage		0	570	V
$V_{i(BE)}$	bridge enable control input voltage	$V_{i(BER)} = 570$ V	570	580	V
		$V_{i(BER)} = 0$ V	0	10	V
$I_{i(BE)}$	bridge enable control input current		0	700	$\mu$ A
$V_{i(EXO)}$	input voltage from external oscillator on pin EXO		0	$V_{DD}$	V
$V_{i(SD)}$	shut-down input voltage on pin SD		0	$V_{DD}$	V
SR	slew rate at output pins	repetitive	-4	+4	V/ns
$T_j$	junction temperature		-40	+150	$^{\circ}$ C
$T_{amb}$	ambient temperature		-40	+150	$^{\circ}$ C
$T_{stg}$	storage temperature		-55	+150	$^{\circ}$ C
$V_{esd}$	electrostatic discharge voltage	note 2			
	pin HV		-1250	+1250	V
	pins BE, BER, FSL, GHL, SHL, SHR, GHR and FSR		-1500	+1500	V

**Notes**

1. This value is guaranteed down to  $T_j = -25$   $^{\circ}$ C. From  $T_j = -25$  to  $-40$   $^{\circ}$ C, the voltage on pin HV is limited to 530 V and the floating supply voltage ( $V_{FSL}, V_{FSR}$ ) is limited to a maximum value of 548 V.
2. In accordance with the human body model: equivalent to discharging a 100 pF capacitor through a 1.5 k $\Omega$  series resistor.

**THERMAL CHARACTERISTICS**

SYMBOL	PARAMETER	VALUE	UNIT
$R_{th(j-a)}$	thermal resistance from junction to ambient	70	K/W

**QUALITY SPECIFICATION**

In accordance with "General Quality Specifications for Integrated Circuits SNW-FQ-611D".

## Full bridge driver IC

## UBA2030T

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
<b>Shut-down;</b> note 2						
V <sub>IH</sub>	HIGH-level input voltage	shut-down active; $\left  \frac{\Delta V_{SD}}{\Delta t} \right  > 5 \text{ V/ms}$	4.5	–	V <sub>DD</sub>	V
V <sub>IL</sub>	LOW-level input voltage	shut-down not active; $\left  \frac{\Delta V_{SD}}{\Delta t} \right  > 5 \text{ V/ms}$	0	–	0.5	V
I <sub>I(SD)</sub>	input current		0	–	50	μA

**Notes**

- The current into pin HV is internally limited to 15 mA at T<sub>j</sub> = 25 °C and to 10 mA at T<sub>j</sub> = 150 °C.
- V<sub>DD</sub> = 15 V.
- The internal ÷2 circuit requires the frequency of the internal or external oscillator to be twice the bridge frequency. When the internal oscillator is used, the bridge frequency can be adjusted using an external resistor and capacitor:
$$f_{\text{bridge}} = \frac{1}{2.8 \times R_{\text{osc}} \times C_{\text{osc}}}$$
 where R<sub>osc(min)</sub> = 200 kΩ and R<sub>osc(max)</sub> = 2 MΩ with low leakage current.
- The 'dead time' is adjusted using an external resistor (R<sub>DT</sub>) connected between pins DTC and SGND. The value is calculated as: R<sub>DT</sub> = 270 × t<sub>dead</sub> – 70, where the units are kΩ for R<sub>DT</sub> and μs for t<sub>dead</sub>. The minimum value R<sub>DT(min)</sub> = 50 kΩ and the maximum value R<sub>DT(max)</sub> = 1 MΩ.
- This function is disabled when using an external oscillator.
- I<sub>IH</sub> < 2.1 mA when the condition is V<sub>BE</sub> – V<sub>BER</sub> = 5 V at T<sub>j</sub> = 150 °C.

## Full bridge driver IC

## UBA2030T

## APPLICATION INFORMATION

## Basic application

A basic full bridge configuration with an HID lamp is shown in Fig.4. The bridge enable and shut-down functions are not used in this application. The EXO, BE, BER and SD pins are connected to system ground. The IC is powered by the high voltage supply.

When the internal oscillator is used, the bridge commutating frequency is determined by the values of  $R_{OSC}$  and  $C_{OSC}$ . The bridge starts oscillating when the HV supply voltage exceeds the 'start oscillating threshold' (typically 15.5 V). If the supply voltage at the HV pin falls below the 'stop oscillating threshold' (typically 13 V), the UBA2030T enters the start-up state.

Fig.4 Basic configuration.

## Full bridge driver IC

## UBA2030T

### Application with external control

Figure 5 shows an application containing an external oscillator control circuit referenced to system ground. The RC, BER and BE pins are connected to system ground.

The bridge commutation frequency is determined by the external oscillator. The shut-down input (pin SD) can be used to quickly turn off all four MOSFETs in the full bridge

Full bridge driver IC

UBA2030T

Automotive application

The life of an HID lamp depends on the rate of sodium migration through its quartz wall. To minimize this, the lamp must be operated negative with respect to system ground.

Figure 6 shows a full bridge with an HID lamp in an automotive environment, and a control circuit referenced to the high side of the bridge. The BER and HV pins are connected to system ground. The bridge can be held in its current state using the BE pin. See the timing diagram in Fig.3.

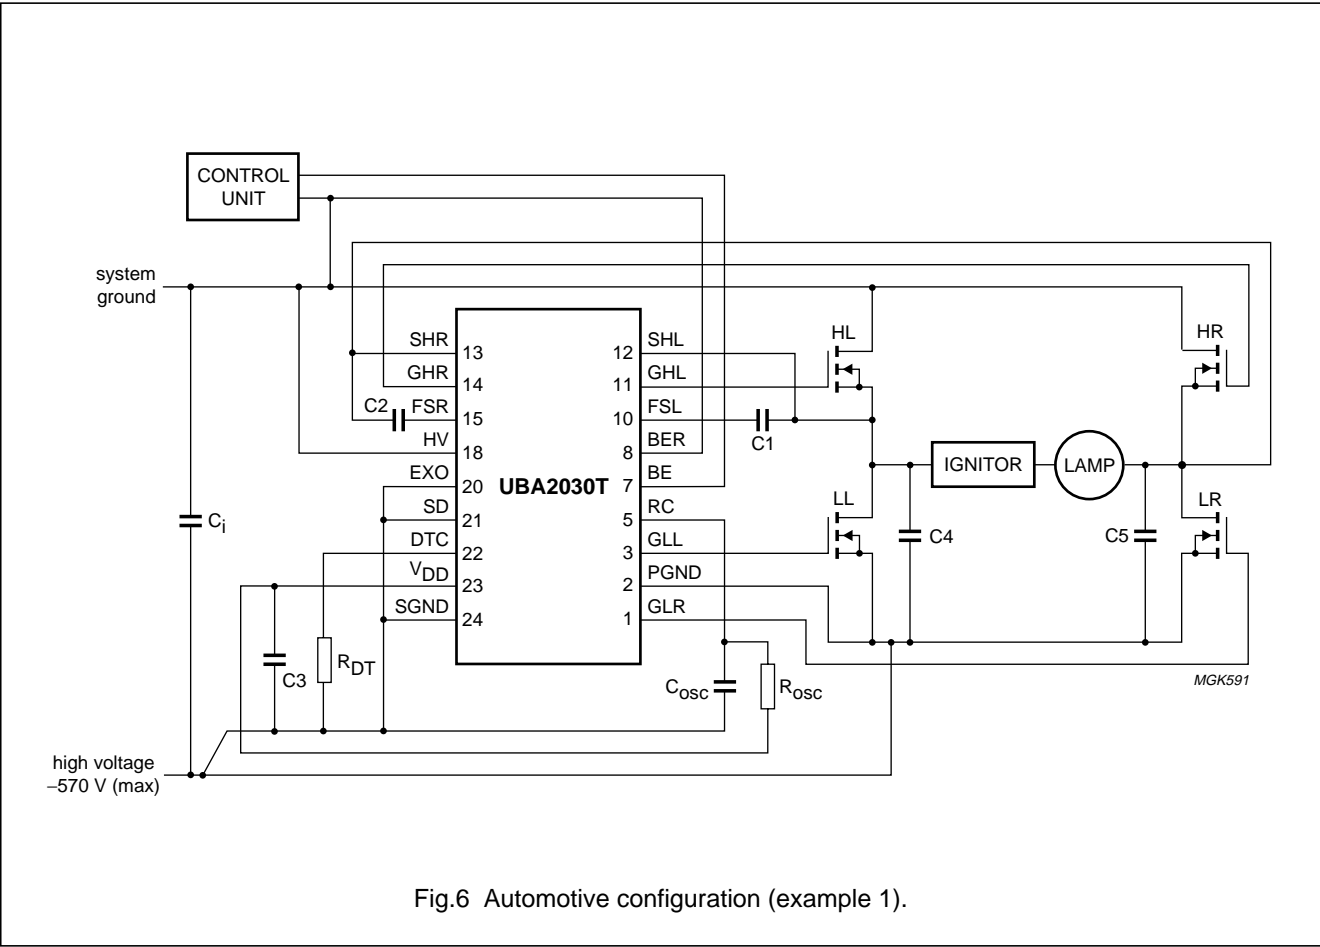

Fig.6 Automotive configuration (example 1).

## Full bridge driver IC

## UBA2030T

## Additional application information

The UBA2030T is the commutator part in a complete system for driving an HID lamp. The life of the HID lamp can depend on the amount of sodium that migrates through its quartz wall. To minimize this migration, the lamp must be operated negative with respect to system ground.

Figure 7 shows a full bridge with an HID lamp in a typical automotive configuration using a control unit referenced to the high side of the bridge. Pin BER is connected to system ground. The bridge can be held in its current state by pin BE. The supply current to the internal low voltage circuit is fed to pin HV which can be connected to either system ground or to a low voltage DC supply, such as a battery, as indicated by the dotted lines in Fig.7.

The diode in series with the supply to pin HV prevents  $C_i$  being discharged if the lamp is shorted during the ignition phase.  $C_6$  should be positioned as close as possible to pin DTC. The control unit drives the MOSFETs relatively hard which can cause radiation. To prevent switching the MOSFETs hard, a resistor can be connected in series with each gate.

In all applications, the voltage on pin HV must not be allowed to become lower than the voltage at pin  $V_{DD}$  during the start-up phase or during normal operation, otherwise the full bridge will not operate correctly. During the start-up phase, pin EXO and pin SD should both be LOW. The voltage as a function of time at pin EXO and pin SD should be  $>5$  V/ms.

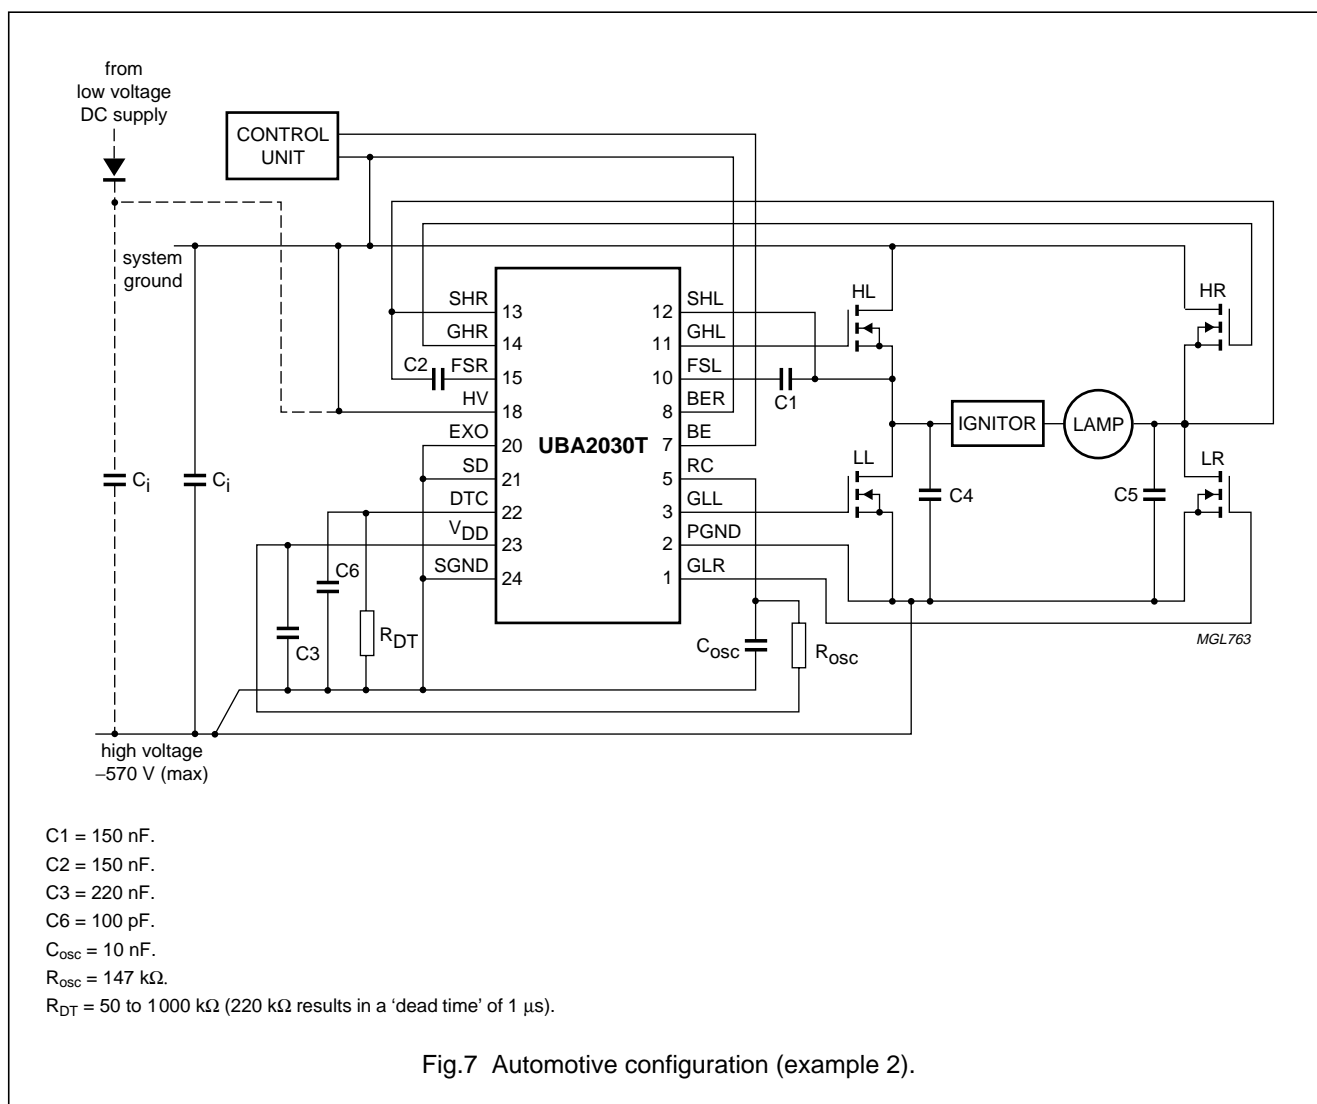

Fig.7 Automotive configuration (example 2).

### SOLDERING

#### Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

#### Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 250 °C. The top-surface temperature of the packages should preferably be kept below 220 °C for thick/large packages, and below 235 °C for small/thin packages.

#### Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
  - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

#### Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

## Full bridge driver IC

UBA2030T

## Suitability of surface mount IC packages for wave and reflow soldering methods

PACKAGE <sup>(1)</sup>	SOLDERING METHOD	
	WAVE	REFLOW <sup>(2)</sup>
BGA, LBGA, LFBGA, SQFP, TFBGA, VFBGA	not suitable	suitable
HBCC, HBGA, HLQFP, HSQFP, HSOP, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable <sup>(3)</sup>	suitable
PLCC <sup>(4)</sup> , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended <sup>(4)(5)</sup>	suitable
SSOP, TSSOP, VSO	not recommended <sup>(6)</sup>	suitable

## Notes

1. For more detailed information on the BGA packages refer to the “(LF)BGA Application Note” (AN01026); order a copy from your Philips Semiconductors sales office.
2. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the “Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods”.
3. These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
4. If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
5. Wave soldering is suitable for LQFP, TQFP and QFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
6. Wave soldering is suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.

## DATA SHEET STATUS

DATA SHEET STATUS <sup>(1)</sup>	PRODUCT STATUS <sup>(2)</sup>	DEFINITIONS
Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Changes will be communicated according to the Customer Product/Process Change Notification (CPCN) procedure SNW-SQ-650A.

## Notes

1. Please consult the most recently issued data sheet before initiating or completing a design.
2. The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.

## DEFINITIONS

**Short-form specification** — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

**Limiting values definition** — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

## DISCLAIMERS

**Life support applications** — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

**Right to make changes** — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
