GENERAL DESCRIPTION

The XRT86VL38 is an eight-channel 1.544 Mbit/s or 2.048 Mbit/s DS1/E1/J1 framer and LIU integrated solution featuring R^3 technology (Relayless, Reconfigurable, Redundancy). The physical interface is optimized with internal impedance, and with the patented pad structure, the XRT86VL38 provides protection from power failures and hot swapping.

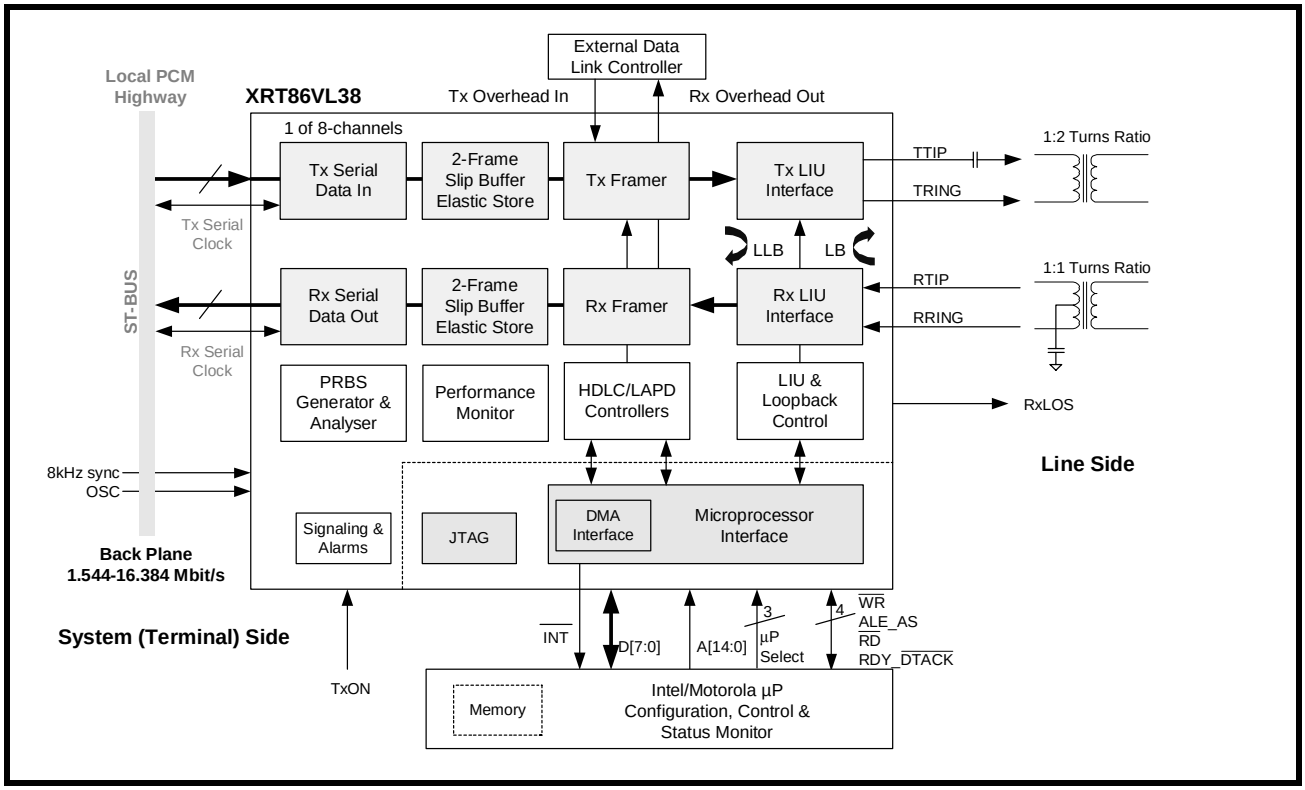
The XRT86VL38 contains an integrated DS1/E1/J1 framer and LIU which provide DS1/E1/J1 framing and error accumulation in accordance with ANSI/ITU_T specifications. Each framer has its own framing synchronizer and transmit-receive slip buffers. The slip buffers can be independently enabled or disabled as required and can be configured to frame to the common DS1/E1/J1 signal formats.

Each Framer block contains its own Transmit and Receive T1/E1/J1 Framing function. There are 3 Transmit HDLC controllers per channel which encapsulate contents of the Transmit HDLC buffers into LAPD Message frames. There are 3 Receive HDLC controllers per channel which extract the payload content of Receive LAPD Message frames from the incoming T1/E1/J1 data stream and write the contents into the Receive HDLC buffers. Each framer also contains a Transmit and Overhead Data Input port, which permits Data Link Terminal Equipment direct access to the outbound T1/E1/J1 frames. Likewise, a Receive Overhead output data port permits Data Link Terminal Equipment direct access to the Data Link bits of the inbound T1/E1/J1 frames.

The XRT86VL38 fully meets all of the latest T1/E1/J1 specifications: ANSI T1/E1.107-1988, ANSI T1/E1.403-1995, ANSI T1/E1.231-1993, ANSI T1/E1.408-1990, AT&T TR 62411 (12-90) TR54016, and ITU G-703, G.704, G706 and G.733, AT&T Pub. 43801, and ETS 300 011, 300 233, JT G.703, JT G.704, JT G706, I.431. Extensive test and diagnostic functions include Loop-backs, Boundary scan, Pseudo Random bit sequence (PRBS) test pattern generation, Performance Monitor, Bit Error Rate (BER) meter, forced error insertion, and LAPD unchannelized data payload processing according to ITU-T standard Q.921.

Applications and Features (next page)

FIGURE 1. XRT86VL38 8-CHANNEL DS1 (T1/E1/J1) FRAMER/LIU COMBO



APPLICATIONS

- High-Density T1/E1/J1 interfaces for Multiplexers, Switches, LAN Routers and Digital Modems
- SONET/SDH terminal or Add/Drop multiplexers (ADMs)
- T1/E1/J1 add/drop multiplexers (MUX)
- Channel Service Units (CSUs): T1/E1/J1 and Fractional T1/E1/J1
- Digital Access Cross-connect System (DACs)
- Digital Cross-connect Systems (DCS)
- Frame Relay Switches and Access Devices (FRADS)
- ISDN Primary Rate Interfaces (PRA)
- PBXs and PCM channel bank
- T3 channelized access concentrators and M13 MUX
- Wireless base stations
- ATM equipment with integrated DS1 interfaces
- Multichannel DS1 Test Equipment
- T1/E1/J1 Performance Monitoring
- Voice over packet gateways
- Routers

FEATURES

- Eight independent, full duplex DS1 Tx and Rx Framer/LIUs
- Two 512-bit (two-frame) elastic store, PCM frame slip buffers (FIFO) on TX and Rx provide up to 8.192 MHz asynchronous back plane connections with jitter and wander attenuation
- Supports input PCM and signaling data at 1.544, 2.048, 4.096 and 8.192 Mbits. Also supports 4-channel multiplexed 12.352/16.384 (HMVIP/H.100) Mbit/s on the back plane bus
- Programmable output clocks for Fractional T1/E1/J1
- Supports Channel Associated Signaling (CAS)
- Supports Common Channel Signalling (CCS)
- Supports ISDN Primary Rate Interface (ISDN PRI) signaling
- Extracts and inserts robbed bit signaling (RBS)
- 3 Integrated HDLC controllers per channel for transmit and receive, each controller having two 96-byte buffers (buffer 0 / buffer 1)
- HDLC Controllers Support SS7
- Timeslot assignable HDLC
- V5.1 or V5.2 Interface
- Automatic Performance Report Generation (PMON Status) can be inserted into the transmit LAPD interface every 1 second or for a single transmission
- Alarm Indication Signal with Customer Installation signature (AIS-CI)
- Remote Alarm Indication with Customer Installation (RAI-CI)
- Gapped Clock interface mode for Transmit and Receive.

- Intel/Motorola and Power PC interfaces for configuration, control and status monitoring
- Parallel search algorithm for fast frame synchronization
- Wide choice of T1 framing structures: SF/D4, ESF, SLC®96, T1DM and N-Frame (non-signaling)
- Direct access to D and E channels for fast transmission of data link information
- PRBS, QRSS, and Network Loop Code generation and detection
- Programmable Interrupt output pin
- Supports programmed I/O and DMA modes of Read-Write access
- Each framer block encodes and decodes the T1/E1/J1 Frame serial data
- Detects and forces Red (SAI), Yellow (RAI) and Blue (AIS) Alarms
- Detects OOF, LOF, LOS errors and COFA conditions
- Loopbacks: Local (LLB) and Line remote (LB)
- Facilitates Inverse Multiplexing for ATM
- Performance monitor with one second polling
- Boundary scan (IEEE 1149.1) JTAG test port
- Accepts external 8kHz Sync reference
- 1.8V Inner Core Voltage
- 3.3V I/O operation with 5V tolerant inputs
- 420-pin PBGA package or 484-pin STBGA package with -40°C to +85°C operation

2.0 PIN DESCRIPTIONS

There are six types of pins defined throughout this pin description and the corresponding symbol is presented in table below. The per-channel pin is indicated by the channel number or the letter 'n' which is appended at the end of the signal name, for example, TxSERn, where "n" indicates channels 0 to 7. All output pins are "tri-stated" upon hardware RESET.

SYMBOL	PIN TYPE
I	Input
O	Output
I/O	Bidirectional
GND	Ground
PWR	Power
NC	No Connect

The structure of the pin description is divided into fourteen groups, as presented in the table below

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxSER0/ TxPOS0 TxSER1/ TxPOS1 TxSER2/ TxPOS2 TxSER3/ TxPOS3 TxSER4/ TxPOS4 TxSER5/ TxPOS5 TxSER6/ TxPOS6 TxSER7/ TxPOS7	D11 D17 E23 K26 AB21 AB15 AB9 AE3	F12 C15 D20 K18 AB21 AA13 U10 W3	I	-	**Transmit Serial Data Input (TxSERn)/Transmit Positive Digital Input (TxPOSn):** The exact function of these pins depends on the mode of operation selected, as described below. **DS1/E1 Mode - TxSERn** These pins function as the transmit serial data input on the system side interface, which are latched on the rising edge of the TxSERCLKn pin. Any payload data applied to this pin will be inserted into an outbound DS1/E1 frame and output to the line. In DS1 mode, the framing alignment bits, facility data link bits, CRC-6 bits, and signaling information can also be inserted from this input pin if configured appropriately. In E1 mode, all data intended to be transported via Time Slots 1 through 15 and Time slots 17 through 31 must be applied to this input pin. Data intended for Time Slots 0 and 16 can also be applied to this input pin If configured accordingly. **DS1 or E1 High-Speed Multiplexed Mode* - TxSERn** In this mode, these pins are used as the high-speed multiplexed data input pin on the system side. High-speed multiplexed data of channels 0-3 must be applied to TxSER0 and high-speed multiplexed data of channels 4-7 must be applied to TxSER4 in a byte or bit-interleaved way. The framer latches in the multiplexed data on TxSER0 and TxSER4 using TxMSYNC/TxINCLK and demultiplexes this data into 4 serial streams. The LIU block will then output the data to the line interface using TxSERCLKn. **DS1 or E1 Framer Bypass Mode - TxPOSn** In this mode, TxSERn is used for the positive digital input pin (TxPOSn) to the LIU. ***NOTE:*** 1. **High-speed multiplexed modes include (For T1/E1) 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.* 2. *In DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).* 3. *These 8 pins are internally pulled "High" for each channel.*

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxSERCLK0/ TxLINECLK0 TxSERCLK1/ TxLINECLK1 TxSERCLK2/ TxLINECLK2 TxSERCLK3/ TxLINECLK3 TxSERCLK4/ TxLINECLK4 TxSERCLK5/ TxLINECLK5 TxSERCLK6/ TxLINECLK6 TxSERCLK7/ TxLINECLK7	A11 C19 D22 K24 AE23 AF15 AE6 AB5	C11 B17 E17 J21 Y18 AA12 U9 V7	I/O	12	**Transmit Serial Clock (TxSERCLKn)/Transmit Line Clock (TxSERCLKn):** The exact function of these pins depends on the mode of operation selected, as described below. **In Base-Rate Mode (1.544MHz/2.048MHz) - TxSERCLKn:** This clock signal is used by the transmit serial interface to latch the contents on the TxSERn pins into the T1/E1 framer on the rising edge of the TxSERCLKn. These pins can be configured as input or output as described below. **When TxSERCLKn is configured as Input:** These pins will be inputs if the TxSERCLK is chosen as the timing source for the transmit framer. Users must provide a 1.544MHz clock rate to this input pin for T1 mode of operation, and 2.048MHz clock rate in E1 mode. **When TxSERCLKn is configured as Output:** These pins will be outputs if either the recovered line clock or the MCLK PLL is chosen as the timing source for the T1/E1 transmit framer. The transmit framer will output a 1.544MHz clock rate in T1 mode of operation, and a 2.048MHz clock rate in E1 mode. **DS1/E1 High-Speed Backplane Modes* - TxSERCLKn as INPUT ONLY** In this mode, TxSERCLK is an optional clock signal input which is used as the timing source for the transmit line interface, and is only required if TxSERCLK is chosen as the timing source for the transmit framer. If TxSERCLK is chosen as the timing source, system equipment should provide 1.544MHz (For T1 mode) or 2.048MHz (For E1 mode) to the TxSERCLKn pins on each channel. TxSERCLK is not required if either the recovered clock or MCLK PLL is chosen as the timing source of the device. High speed or multiplexed data is latched into the device using the TxMSYNC/TxINCLK high-speed clock signal. **DS1 or E1 Framer Bypass Mode - TxLINECLKn** In this mode, TxSERCLKn is used as the transmit line clock (TxLINECLK) to the LIU. ***NOTE:*** **High-speed backplane modes include (For T1/E1) 2.048MVIP, 4.096MHz, 8.192MHz, 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.* ***NOTE:*** *In DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).* ***NOTE:*** *These 8 pins are internally pulled "High" for each channel.*

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxSYNC0/ TxNEG0 TxSYNC1/ TxNEG1 TxSYNC2/ TxNEG2 TxSYNC3/ TxNEG3 TxSYNC4/ TxNEG4 TxSYNC5/ TxNEG5 TxSYNC6/ TxNEG6 TxSYNC7/ TxNEG7	A9 C16 B24 K22 AF24 AF16 AD8 AE4	B9 F14 C20 J20 Y17 V13 AA4 AA2	I/O	12	**Transmit Single Frame Sync Pulse (TxSYNCn) / Transmit Negative Digital Input (TxNEGn):** The exact function of these pins depends on the mode of operation selected, as described below. **DS1/E1 Base Rate Mode (1.544MHz/2.048MHz) - TxSYNCn:** These TxSYNCn pins are used to indicate the single frame boundary within an outbound T1/E1 frame. In both DS1 or E1 mode, the single frame boundary repeats every 125 microseconds (8kHz). In DS1/E1 base rate, TxSYNCn can be configured as either input or output as described below. **When TxSYNCn is configured as an Input**: Users must provide a signal which must pulse "High" for one period of TxSERCLK during the first bit of an outbound DS1/ E1 frame. It is imperative that the TxSYNC input signal be synchronized with the TxSERCLK input signal. **When TxSYNCn is configured as an Output:** The transmit T1/E1 framer will output a signal which pulses "High" for one period of TxSERCLK during the first bit of an outbound DS1/E1 frame. **DS1/E1 High-Speed Backplane Modes* - TxSYNCn as INPUT ONLY:** In this mode, TxSYNCn must be an input regardless of the clock source that is chosen to be the timing source for the transmit framer. In 2.048MVIP/4.096/8.192MHz high-speed modes, TxSYNCn pins must be pulsed 'High' for one period of TxSERCLK during the first bit of the outbound T1/E1 frame. In HMVIP mode, TxSYNC0 and TxSYNC4 must be pulsed 'High' for 4 clock cycles of the TxMSYNC/TxINCLK signal in the position of the first two and the last two bits of a multiplexed frame. In H.100 mode, TxSYNC0 and TxSYNC4 must be pulsed 'High' for 2 clock cycles of the TxMSYNC/TxINCLK signal in the position of the first and the last bit of a multiplexed frame. **DS1 or E1 Framer Bypass Mode - TxNEGn** In this mode, TxSYNCn is used as the negative digital input pin (TxNEG) to the LIU. ***NOTE:*** **High-speed backplane modes include (For T1/E1) 2.048MVIP, 4.096MHz, 8.192MHz, 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.* ***NOTE:*** *In DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).* ***NOTE:*** *These 8 pins are internally pulled "Low" for each channel.*

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxMSYNC0/ TxINCLK0 TxMSYNC1/ TxINCLK1 TxMSYNC2/ TxINCLK2 TxMSYNC3/ TxINCLK3 TxMSYNC4/ TxINCLK4 TxMSYNC5/ TxINCLK5 TxMSYNC6/ TxINCLK6 TxMSYNC7/ TxINCLK7	B10 A17 C24 L24 AC21 AD16 AC8 AF2	A9 B15 E18 K20 U17 AB14 AB3 W5	I/O	12	**Multiframe Sync Pulse (TxMSYNCn) / Transmit Input Clock (TxINCLKn)** The exact function of these pins depends on the mode of operation selected, as described below. **DS1/E1 Base Rate Mode (1.544MHz/2.048MHz) - TxMSYNCn** In this mode, these pins are used to indicate the multi-frame boundary within an outbound DS1/E1 frame. In DS1 ESF mode, TxMSYNCn repeats every 3ms. In DS1 SF mode, TxMSYNCn repeats every 1.5ms. In E1 mode, TxMSYNCn repeats every 2ms. If TxMSYNCn is configured as an input, TxMSYNCn must pulse "High" for one period of TxSERCLK during the first bit of an outbound DS1/E1 multi-frame. It is imperative that the TxMSYNC input signal be synchronized with the TxSERCLK input signal. If TxMSYNCn is configured as an output, the transmit section of the T1/E1 framer will output and pulse TxMSYNC "High" for one period of TxSERCLK during the first bit of an outbound DS1/E1 frame. **DS1/E1 High-Speed Backplane Modes* - (TxINCLKn as INPUT ONLY)** In this mode, this pin must be used as the high-speed input clock pin (TxINCLKn) for the backplane interface to latch in high-speed or multiplexed data on the TxSERn pin. The frequency of TxINCLK is presented in the table below.

OPERATION MODE	FREQUENCY OF TXINCLK(MHZ)
2.048MVIP non-multiplexed	2.048
4.096MHz non-multiplexed	4.096
8.192MHz non-multiplexed	8.192
12.352MHz Bit-multiplexed (DS1 ONLY)	12.352
16.384MHz Bit-multiplexed	16.384
16.384 HMVIP Byte-multiplexed	16.384
16.384 H.100 Byte-multiplexed	16.384

NOTES:

1. **High-speed backplane modes include (For T1/E1) 2.048MVIP, 4.096MHz, 8.192MHz, 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.*
2. *In DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).*
3. *These 8 pins are internally pulled "Low" for each channel.*

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxCHCLK0 TxCHCLK1 TxCHCLK2 TxCHCLK3 TxCHCLK4 TxCHCLK5 TxCHCLK6 TxCHCLK7	A12 E17 B26 J22 AD22 AE16 AD10 AB2	C12 A16 E19 G22 AA19 Y13 V11 V5	O	8	**Transmit Channel Clock Output Signal (TxCHCLKn):** The exact function of this pin depends on whether or not the transmit framer enables the transmit fractional/signaling interface to input fractional data, as described below. **If transmit fractional/signaling interface is disabled:** This pin indicates the boundary of each time slot of an outbound DS1/E1 frame. In T1 mode, each of these output pins is a 192kHz clock which pulses "High" during the LSB of each 24 time slots. In E1 mode, each of these output pins is a 256kHz clock which pulses "High" during the LSB of each 32 time slots. The Terminal Equipment can use this clock signal to sample the TxCHN0 through TxCHN4 time slot identifier pins to determine which time slot is being processed. **If transmit fractional/signaling interface is enabled:** TxCHCLKn is the fractional interface clock which either outputs a clock signal for the time slot that has been configured to input fractional data, or outputs an enable signal for the fractional time slot so that fractional data can be clocked into the device using the TxSERCLK pin. ***NOTE:*** *Transmit fractional interface can be enabled by programming to bit 4 - TxFr1544/TxFr2048 bit from register 0xn120 to '1'.*

TRANSMIT SYSTEM SIDE INTERFACE

TxCHN0_0/ TxSIG0 TxCHN1_0/ TxSIG1 TxCHN2_0/ TxSIG2 TxCHN3_0/ TxSIG3 TxCHN4_0/ TxSIG4 TxCHN5_0/ TxSIG5 TxCHN6_0/ TxSIG6 TxCHN7_0/ TxSIG7	D12 C18 F22 L22 AD21 AC15 AB10 AC5	B11 C16 C21 K19 W16 AB13 W11 W4	I/O	8	**Transmit Time Slot Octet Identifier Output 0 (TxCHNn_0) / Transmit Serial Signaling Input (TxSIGn):** The exact function of these pins depends on whether or not the transmit framer enables the transmit fractional/signaling interface, as described below: **If transmit fractional/signaling interface is disabled - TxCHNn_0:** These output pins (TxCHNn_4 through TxCHNn_0) reflect the five-bit binary value of the current time slot being processed by the transmit serial interface. Terminal Equipment can use the TxCHCLK to sample the five output pins of each channel in order to identify the time slot being processed. This pin indicates the Least Significant Bit (LSB) of the time slot channel being processed. **If transmit fractional/signaling interface is enabled - TxSIGn:** These pins can be used to input robbed-bit signaling data to be inserted within an outbound DS1 frame or to input Channel Associated Signaling (CAS) data within an outbound E1 frame, as described below. **T1 Mode:** Signaling data (A,B,C,D) of each channel must be provided on bit 4,5,6,7 of each time slot on the TxSIG pin if 16-code signaling is used. If 4-code signaling is selected, signaling data (A,B) of each channel must be provided on bit 4, 5 of each time slot on the TxSIG pin. If 2-code signaling is selected, signaling data (A) of each channel must be provided on bit 4 of each time slot on the TxSIG pin. **E1 Mode:** Signaling data in E1 mode can be provided on the TxSIGn pins on a time-slot-basis as in T1 mode, or it can be provided on time slot 16 only via the TxSIGn input pins. In the latter case, signaling data (A,B,C,D) of channel 1 and channel 17 must be inserted on the TxSIGn pin during time slot 16 of frame 1, signaling data (A,B,C,D) of channel 2 and channel 18 must be inserted on the TxSIGn pin during time slot 16 of frame 2...etc. The CAS multiframe Alignments bits (0000 bits) and the extra bits/alarm bit (xyxx) must be inserted on the TxSIGn pin during time slot 16 of frame 0. ***NOTE:*** *Transmit fractional interface can be enabled by programming to bit 4 - TxFr1544/TxFr2048 bit from register 0xn120 to '1'.* ***NOTE:*** *These 8 pins are internally pulled "Low" for each channel.*

Terminal Equipment can use the TxCHCLK to sample the five output pins of each channel in order to identify the time slot being processed. This pin indicates Bit 3 of the time slot channel being processed. **If transmit fractional/signaling interface is enabled - TxOHSYNCn** These pins are used to output an Overhead Synchronization Pulse which indicates the first bit of each multi-frame. ***NOTE:*** *Transmit fractional interface can be enabled by programming to bit 4 - TxFr1544/TxFr2048 bit from register 0xn120 to '1'.*
TxCHN0_4 TxCHN1_4 TxCHN2_4 TxCHN3_4 TxCHN4_4 TxCHN5_4 TxCHN6_4 TxCHN7_4	C14 A21 E25 M26 AD19 AC14 AE8 AB4	A13 G17 C22 L17 AA16 AB11 W9 U7	O	8	**Transmit Time Slot Octet Identifier Output-Bit 4 (TxCHNn_4):** These output signals (TxCHNn_4 through TxCHNn_0) reflect the five-bit binary value of the current time slot being processed by the transmit serial interface. Terminal Equipment can use the TxCHCLK to sample the five output pins of each channel in order to identify the time slot being processed. This pin indicates the Most Significant Bit (MSB) of the time slot channel being processed.

TRANSMIT OVERHEAD INTERFACE

SIGNAL NAME	420 PKG BALL #	484 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxOH0 TxOH1 TxOH2 TxOH3 TxOH4 TxOH5 TxOH6 TxOH7	C12 A18 E26 J25 AF25 AD14 AF10 AC2	E13 B16 E21 J18 W17 AA11 U11 AA1	I	-	**Transmit Overhead Input (TxOHn):** The exact function of these pins depends on the mode of operation selected, as described below. **DS1 Mode** These pins operate as the source of Datalink bits which will be inserted into the Datalink bits within an outbound DS1 frame if the framer is configured accordingly. Datalink Equipment can provide data to this input pin using the TxOHCLKn clock at either 2kHz or 4kHz depending on the transmit datalink bandwidth selected. ***NOTE:*** *This input pin will be disabled if the framer is using the Transmit HDLC Controller, or the TxSER input as the source for the Data Link Bits.* **E1 Mode** These pins operate as the source of Datalink bits or Signaling bits depending on the framer configuration, as described below. **Sourcing Datalink bits from TxOHn:** The E1 transmit framer will output a clock edge on TxOHCLKn for each Sa bit that has been configured to carry datalink information. Terminal equipment can then use TxOHCLKn to provide datalink bits on TxOHn to be inserted into the Sa bits within an outbound E1 frame. **Sourcing Signaling bits from TxOHn:** Users must provide signaling data on TxOHn pins on time slot 16 only. Signaling data (A,B,C,D) of channel 1 and channel 17 must be inserted on the TxOHn pin during time slot 16 of frame 1, signaling data (A,B,C,D) of channel 2 and channel 18 must be inserted on the TxOHn pin during time slot 16 of frame 2...etc. The CAS multiframe Alignments bits (0000 bits) and the extra bits/alarm bit (xyxx) must be inserted on the TxOHn pin during time slot 16 of frame 0. ***NOTE:*** *These 8 pins are internally pulled "Low" for each channel.*

TRANSMIT OVERHEAD INTERFACE

SIGNAL NAME	420 PKG BALL #	484 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxOHCLK0 TxOHCLK1 TxOHCLK2 TxOHCLK3 TxOHCLK4 TxOHCLK5 TxOHCLK6 TxOHCLK7	E11 A19 E24 K23 AF23 AB16 AC10 AE1	A10 A17 B22 H22 AB20 U13 AA7 V6	O	8	**Transmit OH Serial Clock Output Signal(TxOHCLKn)** This pin functions as an overhead output clock signal for the transmit overhead interface, and its function is explained below. **DS1 Mode** If the TxOH pins have been configured to be the source for Datalink bits, the DS1 transmit framer will provide a clock edge for each Data Link Bit. In DS1 ESF mode, the TxOHCLK can either be a 2kHz or 4kHz output signal depending on the selection of Data Link Bandwidth (Register 0xn10A). Data Link Equipment can provide data to the TxOHn pin on the rising edge of TxOHCLK. The framer latches the data on the falling edge of this clock signal. **E1 Mode** If the TxOH pins have been configured to be the source for Data Link bits, the E1 transmit framer will provide a clock edge for each National Bit (Sa bits) that has been configured to carry data link information. (Register 0xn10A)

RECEIVE OVERHEAD INTERFACE

SIGNAL NAME	420 PKG BALL #	484 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
RxOH0 RxOH1 RxOH2 RxOH3 RxOH4 RxOH5 RxOH6 RxOH7	C11 B15 D21 F26 AA22 AE17 AE14 AF7	D11 A14 D18 H18 V18 Y14 U12 V10	O	8	**Receive Overhead Output (RxOHn):** These pins function as the Receive Overhead output, or Receive Signaling Output depending on the receive framer configuration, as described below. **DS1 Mode** If the RxOH pins have been configured as the destination for the Data Link bits within an inbound DS1 frame, datalink bits will be output to the RxOHn pins at either 2kHz or 4kHz depending on the Receive datalink bandwidth selected. (Register 0xn10C). If configured appropriately, signaling information in the receive signaling array registers (Registers 0xn500-0xn51F) can also be output to the RxOHn output pins. **E1 Mode** These output pins will always output the contents of the National Bits (Sa4 through Sa8) if these Sa bits have been configured to carry Data Link information (Register 0xn10C). The Receive Overhead Output Interface will provide a clock edge on RxOHCLKn for each Sa bit carrying Data Link information. If configured appropriately, signaling information in the receive signaling array registers (Registers 0xn500-0xn51F) can also be output to the RxOHn output pins.
RxOHCLK0 RxOHCLK1 RxOHCLK2 RxOHCLK3 RxOHCLK4 RxOHCLK5 RxOHCLK6 RxOHCLK7	B9 D16 E21 G24 Y22 AF17 AE13 AE7	F11 D14 A21 E22 V19 AA14 AB10 Y6	O	8	**Receive Overhead Clock Output (RxOHCLKn):** This pin functions as an overhead output clock signal for the receive overhead interface, and its function is explained below. **DS1 Mode** If the RxOH pins have been configured to be the destination for Datalink bits, the DS1 transmit framer will output a clock edge for each Data Link Bit. In DS1 ESF mode, the RxOHCLK can either be a 2kHz or 4kHz output signal depending on the selection of Data Link Bandwidth (Register 0xn10C). Data Link Equipment can clock out datalink bits on the RxOHn pin using this clock signal. **E1 Mode** The E1 receive framer provides a clock edge for each National Bit (Sa bits) that is configured to carry data link information. Data Link Equipment can clock out datalink bits on the RxOHn pin using this clock signal.

RECEIVE SYSTEM SIDE INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
RxSYNC0/ RxNEG0 RxSYNC1/ RxNEG1 RxSYNC2/ RxNEG2 RxSYNC3/ RxNEG3 RxSYNC4/ RxNEG4 RxSYNC5/ RxNEG5 RxSYNC6/ RxNEG6 RxSYNC7/ RxNEG7	D9 D15 D19 G23 AE26 AF19 AB11 AC6	A8 E16 A18 D22 Y20 Y15 AA6 Y3	I/O	12	**Receive Single Frame Sync Pulse (RxSYNCn):** The exact function of these pins depends on the mode of operation selected, as described below. **DS1/E1 Base Rate Mode (1.544MHz/2.048MHz) - RxSYNCn:** These RxSYNCn pins are used to indicate the single frame boundary within an inbound T1/E1 frame. In both DS1 or E1 mode, the single frame boundary repeats every 125 microseconds (8kHz). In DS1/E1 base rate, RxSYNCn can be configured as either input or output depending on the slip buffer configuration as described below. **When RxSYNCn is configured as an Input**: Users must provide a signal which must pulse "High" for one period of RxSERCLK and repeats every 125µS. The receive serial Interface will output the first bit of an inbound DS1/E1 frame during the provided RxSYNC pulse. ***NOTE:*** *It is imperative that the RxSYNC input signal be synchronized with the RxSERCLK input signal.* **When RxSYNCn is configured as an Output:** The receive T1/E1 framer will output a signal which pulses "High" for one period of RxSERCLK during the first bit of an inbound DS1/E1 frame. **DS1/E1 High-Speed Backplane Modes* - RxSYNCn as INPUT ONLY:** In this mode, RxSYNCn must be an input regardless of the slip buffer configuration. In 2.048MVIP/4.096/ 8.192MHz high-speed modes, RxSYNCn pins must be pulsed 'High' for one period of RxSERCLK during the first bit of the inbound T1/E1 frame. In HMVIP mode, RxSYNCn must be pulsed 'High' for 4 clock cycles of the RxSERCLK signal in the position of the first two and the last two bits of a multiplexed frame. In H.100 mode, RxSYNCn must be pulsed 'High' for 2 clock cycles of the RxSERCLK signal in the position of the first and the last bit of a multiplexed frame. **DS1 or E1 Framer Bypass Mode - RxNEGn** In this mode, RxSYNCn is used as the Receive negative digital output pin (RxNEG) from the LIU. ***NOTE:*** **High-speed backplane modes include (For T1/ E1) 2.048MVIP, 4.096MHz, 8.192MHz, 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.* ***NOTE:*** *In DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).* ***NOTE:*** *These 8 pins are internally pulled "Low" for each channel.*

RECEIVE SYSTEM SIDE INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
RxCRCSYNC0 RxCRCSYNC1 RxCRCSYNC2 RxCRCSYNC3 RxCRCSYNC4 RxCRCSYNC5 RxCRCSYNC6 RxCRCSYNC7	B8 D13 E20 G25 AB25 AF21 AE10 AD5	B8 B12 A20 G20 Y21 AA17 Y9 V9	O	12	**Receive Multiframe Sync Pulse (RxCRCSYNCn):** The RxCRCSYNCn pins are used to indicate the receive multi-frame boundary. These pins pulse "High" for one period of RxSERCLK when the first bit of an inbound DS1/E1 Multi-frame is being output on the RxCRCSYNCn pin. • In DS1 ESF mode, RxCRCSYNCn repeats every 3ms • In DS1 SF mode, RxCRCSYNCn repeats every 1.5ms • In E1 mode, RxCRCSYNCn repeats every 2ms.
RxCASYNC0 RxCASYNC1 RxCASYNC2 RxCASYNC3 RxCASYNC4 RxCASYNC5 RxCASYNC6 RxCASYNC7	E10 E15 A23 H23 AD24 AE19 AC9 AF6	C10 B14 C18 F21 V17 AB17 Y8 W10	O	12	**Receive CAS Multiframe Sync Pulse (RxCASYNCn):** **- E1 Mode Only** The RxCASYNCn pins are used to indicate the E1 CAS Multif-frame boundary. These pins pulse "High" for one period of RxSERCLK when the first bit of an E1 CAS Multi-frame is being output on the RxCASYNCn pin.

RECEIVE SYSTEM SIDE INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
RxSERCLK0/ RxLINECLK0 RxSERCLK1/ RxLINECLK1 RxSERCLK2/ RxLINECLK2 RxSERCLK3/ RxLINECLK3 RxSERCLK4/ RxLINECLK4 RxSERCLK5/ RxLINECLK5 RxSERCLK6/ RxLINECLK6 RxSERCLK7/ RxLINECLK7	A6 B13 C20 H25 AD26 AC19 AB12 AB6	D9 A12 B18 H20 W20 V16 W12 W6	I/O	12	**Receive Serial Clock Signal (RxSERCLKn) / Receive Line Clock (RxLINECLKn):** The exact function of these pins depends on the mode of operation selected, as described below. **In Base-Rate Mode (1.544MHz/2.048MHz) - RxSERCLKn:** These pins are used as the receive serial clock on the system side interface which can be configured as either input or output. The receive serial interface outputs data on RxSERn on the rising edge of RxSERCLKn. **When RxSERCLKn is configured as Input:** These pins will be inputs if the slip buffer on the Receive path is enabled. System side equipment must provide a 1.544MHz clock rate to this input pin for T1 mode of operation, and 2.048MHz clock rate in E1 mode. **When RxSERCLKn is configured as Output:** These pins will be outputs if slip buffer is bypassed. The receive framer will output a 1.544MHz clock rate in T1 mode of operation, and a 2.048MHz clock rate in E1 mode. **DS1/E1 High-Speed Backplane Modes* - (RxSERCLK as INPUT ONLY)** In this mode, this pin must be used as the high-speed input clock for the backplane interface to output high-speed or multiplexed data on the RxSERn pin. The frequency of RxSERCLK is presented in the table below.

OPERATION MODE	FREQUENCY OF RXSERCLK(MHZ)
2.048MVIP non-multiplexed	2.048
4.096MHz non-multiplexed	4.096
8.192MHz non-multiplexed	8.192
12.352MHz Bit-multiplexed (DS1 ONLY)	12.352
16.384MHz Bit-multiplexed	16.384
16.384 HMVIP Byte-multiplexed	16.384
16.384 H.100 Byte-multiplexed	16.384

NOTES:

1. **High-speed backplane modes include (For T1/E1) 2.048MVIP, 4.096MHz, 8.192MHz, 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.*
2. *For DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).*

RECEIVE SYSTEM SIDE INTERFACE

This output pin, along with the corresponding TRING output pin, function as the Transmit DS1/E1 output signal drivers for the XRT86VL38 device. The user is expected to connect this signal and the corresponding TRING output signal to a 1:2 step up transformer for proper operation. This output pin will be tri-stated whenever the user sets the “TxON” input pin or register bit (0xnF02, bit 3) to “0”. ***NOTE:*** *This pin should have a series line capacitor of 0.68μF for DC blocking purposes.*
TRING0 TRING1 TRING2 TRING3 TRING4 TRING5 TRING6 TRING7	G4 H4 K4 L4 M4 P4 R4 U4	F1 J5 J1 L4 M3 P5 R2 U2	O	**Transmit Negative Analog Output (TRINGn):** TRING is the negative differential output to the line interface. This output pin, along with the corresponding TTIP output pin, function as the Transmit DS1/E1 output signal drivers for the XRT86VL38 device. The user is expected to connect this signal and the corresponding TRING output signal to a 1:2 step up transformer for proper operation. ***NOTE:*** *This output pin will be tri-stated whenever the user sets the “TxON” input pin or register bit (0xnF02, bit 3) to “0”.*

TRANSMIT LINE INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	DESCRIPTION
TxON	Y3	W1	I	**Transmitter On** This input pin permits the user to either enable or disable the Transmit Output Driver within the Transmit DS1/E1 LIU Block. If the TxON pin is pulled "Low", all 8 Channels are tri-stated. When this pin is pulled 'High', turning on or off the transmitters will be determined by the appropriate channel registers (address 0x0Fn2, bit 3) **LOW** = Disables the Transmit Output Driver within the Transmit DS1/E1 LIU Block. In this setting, the TTIP and TRING output pins of all 8 channels will be tri-stated. **HIGH** = Enables the Transmit Output Driver within the Transmit DS1/E1 LIU Block. In this setting, the corresponding TTIP and TRING output pins will be enabled or disabled by programming the appropriate channel register. (address 0x0Fn2, bit 3) ***NOTE:*** *Whenever the transmitters are turned off, the TTIP and TRING output pins will be tri-stated.*

TIMING INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
MCLKIN	A4	A5	I	-	**Master Clock Input:** This pin is used to provide the timing reference for the internal master clock of the device. The frequency of this clock is programmable from 8kHz to 16.384MHz in register 0x0FE9.
E1MCLKnOUT	B5	A4	O	12	**LIU E1 Output Clock Reference** This output pin is defaulted to 2.048MHz, but can be programmed to 4.096MHz, 8.192MHz, or 16.384MHz in register 0x0FE4.
T1MCLKnOUT	D6	F9	O	12	**LIU T1 Output Clock Reference** This output pin is defaulted to 1.544MHz, but can be programmed to output 3.088MHz, 6.176MHz, or 12.352MHz in register 0x0FE4.
E1OSCCLK	Y5	V4	O	8	**Framer E1 Output Clock Reference** This output pin is defaulted to 2.048MHz, but can be programmed to 65.536MHz in register 0x011E.
T1OSCCLK	AC1	V3	O	8	**Framer T1 Output Clock Reference** This output pin is defaulted to 1.544MHz, but can be programmed to output 49.408MHz in register 0x011E.
8KSYNC	AB3	W2	O	8	**8kHz Clock Output Reference** This pin is an output reference of 8kHz based on the MCLKIN input. Therefore, the duty cycle of this output is determined by the time period of the input clock reference.

TIMING INTERFACE

SIGNAL NAME	420 PKG BALL#	484 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
8KEXTOSC	AA2	U5	I	-	**External Oscillator Select** For normal operation, this pin should not be used, or pulled "Low". This pin is internally pulled "Low" with a 50kΩ resistor.
ANALOG	C5	D4	O		**Factory Test Mode Pin** ***NOTE:*** *For Internal Use Only*
LOP	AB1	V2	I	-	**Loss of Power for E1 Only** This is a Loss of Power pin in the E1 application only. Upon detecting LOP in E1 mode, the device will automatically transmit the Sa5 and Sa6 bit to a different pattern, so that the Receive terminal can detect a power failure in the network. Please see register 0xn131 for the Transmit SA control.
SENSE	E6	E6	O		***NOTE:*** *For Internal Use Only*

JTAG INTERFACE

The XRT86VL38 device's JTAG features comply with the IEEE 1149.1 standard. Please refer to the industry specification for additional information on boundary scan operations.

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
TCK	A7	F10	I	-	**Test clock: Boundary Scan Test clock input:** The TCLK signal is the clock for the TAP controller, and it generates the boundary scan data register clocking. The data on TMS and TDI is loaded on the positive edge of TCK. Data is observed at TDO on the falling edge of TCK.
TMS	A5	B6	I	-	**Test Mode Select:** Boundary Scan Test Mode Select input. The TMS signal controls the transitions of the TAP controller in conjunction with the rising edge of the test clock (TCK). ***NOTE:*** *For normal operation this pin must be pulled 'High'.*
TDI	D7	E9	I	-	**Test Data In:** Boundary Scan Test data input The TDI signal is the serial test data input. ***NOTE:*** *This pin is internally pulled 'high'.*
TDO	B6	D8	O	8	**Test Data Out:** Boundary Scan Test data output The TDO signal is the serial test data output.
TRST	B7	A6	I	-	**Test Reset Input:** The TRST signal (Active Low) asynchronously resets the TAP controller to the Test-Logic-Reset state. ***NOTE:*** *This pin is internally pulled 'high'*
TEST	B11	E12	I	-	**Factory Test Mode Pin** ***NOTE:*** *This pin is internally pulled 'low', and should be pulled 'low' for normal operation.*
aTEST	E7	C7	I	-	**Factory Test Mode Pin** ***NOTE:*** *This pin is internally pulled 'low', and should be pulled 'low' for normal operation.*
JTAG_Ring	D4	C2	I	-	**JTAG_Ring Test Pin**
JTAG_Tip	F5	E5	I	-	**JTAG_Tip Test Pin**

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
DATA0 DATA1 DATA2 DATA3 DATA4 DATA5 DATA6 DATA7	Y26 W24 T25 T26 P24 N25 N24 M25	T19 U20 P21 N18 M22 M20 M21 L21	I/O	8	**Bidirectional Microprocessor Data Bus** These pins are used to drive and receive data over the bi-directional data bus, whenever the Microprocessor performs READ or WRITE operations with the Microprocessor Interface of the XRT86VL38 device. When DMA interface is enabled, these 8-bit bidirectional data bus is also used by the T1/E1 Framer or the external DMA Controller for storing and retrieving information.
$\overline{\text{REQ0}}$	AB26	U19	O	8	**DMA Cycle Request Output—DMA Controller 0 (Write)**: These output pins are used to indicate that DMA transfers (Write) are requested by the T1/E1 Framer. On the transmit side (i.e., To transmit data from external DMA controller to HDLC buffers within the XRT86VL38), DMA transfers are only requested when the transmit buffer status bits indicate that there is space for a complete message or cell. The DMA Write cycle starts by T1/E1 Framer asserting the DMA Request ($\overline{\text{REQ0}}$) 'low', then the external DMA controller should drive the DMA Acknowledge ($\overline{\text{ACK0}}$) 'low' to indicate that it is ready to start the transfer. The external DMA controller should place new data on the Microprocessor data bus each time the Write Signal is Strobed low if the $\overline{\text{WR}}$ is configured as a Write Strobe. If $\overline{\text{WR}}$ is configured as a direction signal, then the external DMA controller would place new data on the Microprocessor data bus each time the Read Signal ($\overline{\text{RD}}$) is Strobed low. The Framer asserts this output pin (toggles it "Low") when at least one of the Transmit HDLC buffers are empty and can receive one more HDLC message. The Framer negates this output pin (toggles it "High") when the HDLC buffer can no longer receive another HDLC message.

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{\text{REQ1}}$	AA24	Y22	O	8	**DMA Cycle Request Output—DMA Controller 1 (Read):** These output pins are used to indicate that DMA transfers (Read) are requested by the T1/E1 Framer. On the receive side (i.e., To transmit data from HDLC buffers within the XRT86VL38 to external DMA Controller), DMA transfers are only requested when the receive buffer contains a complete message or cell. The DMA Read cycle starts by T1/E1 Framer asserting the DMA Request ($\overline{\text{REQ1}}$) 'low', then the external DMA controller should drive the DMA Acknowledge ($\overline{\text{ACK1}}$) 'low' to indicate that it is ready to receive the data. The T1/E1 Framer should place new data on the Microprocessor data bus each time the Read Signal is Strobed low if the $\overline{\text{RD}}$ is configured as a Read Strobe. If $\overline{\text{RD}}$ is configured as a direction signal, then the T1/E1 Framer would place new data on the Microprocessor data bus each time the Write Signal ($\overline{\text{WR}}$) is Strobed low. The Framer asserts this output pin (toggles it "Low") when one of the Receive HDLC buffer contains a complete HDLC message that needs to be read by the µC/µP. The Framer negates this output pin (toggles it "High") when the Receive HDLC buffers are depleted.
$\overline{\text{INT}}$	R26	N22	O	8	**Interrupt Request Output:** This active-low output signal will be asserted when the XRT86VL38 device is requesting interrupt service from the Microprocessor. This output pin should typically be connected to the "Interrupt Request" input of the Microprocessor. The Framer will assert this active "Low" output (toggles it "Low"), to the local µP, anytime it requires interrupt service.

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
PCLK	Y25	V22	I	-	**Microprocessor Clock Input:** This clock input signal is only used if the Microprocessor Interface has been configured to operate in the Synchronous Modes (e.g., Power PC 403 Mode). If the Microprocessor Interface is configured to operate in this mode, then it will use this clock signal to do the following. **1.** To sample the $\overline{CS}$, $\overline{WR}$/R/$\overline{W}$, A[14:0], D[7:0], $\overline{RD}$/$\overline{DS}$ and DBEN input pins, and **2.** To update the state of the D[7:0] and the RDY/DTACK output signals. ***NOTES:*** *1. The Microprocessor Interface can work with PCLK frequencies ranging up to 33MHz.* *2. This pin is inactive if the user has configured the Microprocessor Interface to operate in either the Intel-Asynchronous or the Motorola-Asynchronous Modes. In this case, the user should tie this pin to GND.* When DMA interface is enabled, the PCLK input pin is also used by the T1/E1 Framer to latch in or latch out receive or output data respectively.
iADDR	W22	R18	I	-	**This Pin Must be Tied "Low" for Normal Operation.** This pin is internally pulled "High" with a 50kΩ resistor.
fADDR	AA26	T18	I	-	**This Pin Must be Tied "High" for Normal Operation.** This pin is internally pulled "Low" with a 50kΩ resistor.
PTYPE0 PTYPE1 PTYPE2	W23 W26 R25	V20 T20 N21	I	-	**Microprocessor Type Input:** These input pins permit the user to specify which type of Microprocessor/Microcontroller to be interfaced to the XRT86VL38 device. The following table presents the three different microprocessor types that the XRT86VL38 supports. **µPType2 / µPType1 / µPType0 / MICROPROCESSOR TYPE** 0 0 0 — 68HC11, 8051, 80C188 0 0 1 — MOTOROLA 68K 1 0 1 — IBM POWER PC 403 ***NOTE:*** *These pins are internally pulled "Low" with a 50kΩ resistor.*

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{RDY}$	V24	R19	O	12	**Ready/Data Transfer Acknowledge Output:** The exact behavior of this pin depends upon the type of Microprocessor/Microcontroller the XRT86VL38 has been configured to operate in, as defined by the PTYPE[2:0] pins. **Intel Asynchronous Mode - $\overline{RDY}$ - Ready Output** Tis output pin will function as the “active-low” READY output. During a READ or WRITE cycle, the Microprocessor Interface block will toggle this output pin to the logic low level, ONLY when the Microprocessor Interface is ready to complete or terminate the current READ or WRITE cycle. Once the Microprocessor has determined that this input pin has toggled to the logic “low” level, then it is now safe for it to move on and execute the next READ or WRITE cycle. If (during a READ or WRITE cycle) the Microprocessor Interface block is holding this output pin at a logic “high” level, then the Microprocessor is expected to extend this READ or WRITE cycle, until it detects this output pin being toggled to the logic low level. **Motorola Asynchronous Mode - $\overline{DTACK}$ - Data Transfer Acknowledge Output** Tis output pin will function as the “active-low” DTACK output. During a READ or WRITE cycle, the Microprocessor Interface block will toggle this output pin to the logic low level, ONLY when the Microprocessor Interface is ready to complete or terminate the current READ or WRITE cycle. Once the Microprocessor has determined that this input pin has toggled to the logic “low” level, then it is now safe for it to move on and execute the next READ or WRITE cycle. If (during a READ or WRITE cycle) the Microprocessor Interface block is holding this output pin at a logic “high” level, then the Microprocessor is expected to extend this READ or WRITE cycle, until it detects this output pin being toggled to the logic low level.

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{RDY}$	V24	R19	O	12	**(Con't)** **Power PC 403 Mode - RDY Ready Output:** This output pin will function as the "active-high" READY output. During a READ or WRITE cycle, the Microprocessor Interface block will toggle this output pin to the logic high level, ONLY when the Microprocessor Interface is ready to complete or terminate the current READ or WRITE cycle. Once the Microprocessor has sampled this signal being at the logic "high" level upon the rising edge of PCLK, then it is now safe for it to move on and execute the next READ or WRITE cycle. If (during a READ or WRITE cycle) the Microprocessor Interface block is holding this output pin at a logic "low" level, then the Microprocessor is expected to extend this READ or WRITE cycle, until it samples this output pin being at the logic low level. ***NOTE:*** *The Microprocessor Interface will update the state of this output pin upon the rising edge of PCLK.*
ADDR0 ADDR1 ADDR2 ADDR3 ADDR4 ADDR5 ADDR6 ADDR7 ADDR8 ADDR9 ADDR10 ADDR11 ADDR12 ADDR13 ADDR14	V25 V26 U22 U23 U24 U25 U26 T22 T24 R23 R24 P22 P25 N23 N22	P18 N17 T21 T22 R20 R21 R22 P19 P20 N19 N20 M18 M19 L18 L22	I	-	**Microprocessor Interface Address Bus Input** These pins permit the Microprocessor to identify on-chip registers and Buffer/Memory locations within the XRT86VL38 device whenever it performs READ and WRITE operations with the XRT86VL38 device. ***NOTE:*** *These pins are internally pulled "Low" with a 50kΩ resistor, except ADDR[8:14].*
$\overline{DBEN}$	V23	U22	I	-	**Data Bus Enable Input pin.** This active-low input pin permits the user to either enable or tri-state the Bi-Directional Data Bus pins (D[7:0]), as described below. • Setting this input pin "low" enables the Bi-directional Data bus. • Setting this input pin "high" tri-states the Bi-directional Data Bus.

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
ALE	R22	P22	I	-	**Address Latch Enable Input Address Strobe** The exact behavior of this pin depends upon the type of Microprocessor/Microcontroller the XRT86VL38 has been configured to operate in, as defined by the PTYPE[2:0] pins. **Intel-Asynchronous Mode - ALE** This active-high input pin is used to latch the address (present at the Microprocessor Interface Address Bus pins (A[14:0]) into the XRT86VL38 Microprocessor Interface block and to indicate the start of a READ or WRITE cycle. Pulling this input pin "high" enables the input bus drivers for the Address Bus input pins (A[14:0]). The contents of the Address Bus will be latched into the XRT86VL38 Microprocessor Interface circuitry, upon the falling edge of this input signal. **Motorola-Asynchronous (68K) Mode - $\overline{\text{AS}}$** This active-low input pin is used to latch the data residing on the Address Bus, A[14:0] into the Microprocessor Interface circuitry of the XRT86VL38 device. Pulling this input pin "low" enables the input bus drivers for the Address Bus input pins. The contents of the Address Bus will be latched into the Microprocessor Interface circuitry, upon the rising edge of this signal. **Power PC 403 Mode - No Function -Tie to GND:** This input pin has no role nor function and should be tied to GND.
$\overline{\text{CS}}$	L26	K21	I	-	**Microprocessor Interface—Chip Select Input:** The user must assert this active low signal in order to select the Microprocessor Interface for READ and WRITE operations between the Microprocessor and the XRT86VL38 on-chip registers and buffer/memory locations.

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{RD}$	W25	U21	I	-	**Microprocessor Interface—Read Strobe Input:** The exact behavior of this pin depends upon the type of Microprocessor/Microcontroller the Framer has been configured to operate in, as defined by the PTYPE[2:0] pins. **Intel-Asynchronous Mode - $\overline{RD}$ - READ Strobe Input:** This input pin will function as the **$\overline{RD}$** (Active Low Read Strobe) input signal from the Microprocessor. Once this active-low signal is asserted, then the XRT86VL38 device will place the contents of the addressed register (or buffer location) on the Microprocessor Interface Bi-directional data bus (D[7:0]). When this signal is negated, then the Data Bus will be tri-stated. **Motorola-Asynchronous (68K) Mode - $\overline{DS}$ - Data Strobe:** This input pin will function as the $\overline{DS}$ (Data Strobe) input signal. **Power PC 403 Mode - $\overline{WE}$ - Write Enable Input:** This input pin will function as the $\overline{WE}$ (Write Enable) input pin. Anytime the Microprocessor Interface samples this active-low input signal (along with $\overline{CS}$ and $\overline{WR}$/R/$\overline{W}$) also being asserted (at a logic low level) upon the rising edge of PCLK, then the Microprocessor Interface will (upon the very same rising edge of PCLK) latch the contents on the Bi-Directional Data Bus (D[7:0]) into the "target" on-chip register or buffer location within the XRT86VL38 device.
$\overline{WR}$	M23	L20	I	-	**Microprocessor Interface—Write Strobe Input** The exact behavior of this pin depends upon the type of Microprocessor/Microcontroller the XRT86VL38 has been configured to operate in, as defined by the PTYPE[2:0] pins. **Intel-Asynchronous Mode - $\overline{WR}$ - Write Strobe Input:** This input pin functions as the $\overline{WR}$ (Active Low WRITE Strobe) input signal from the Microprocessor. Once this active-low signal is asserted, then the input buffers (associated with the Bi-Directional Data Bus pin, D[7:0]) will be enabled. The Microprocessor Interface will latch the contents on the Bi-Directional Data Bus (into the "target" register or address location, within the XRT86VL38) upon the rising edge of this input pin. **Motorola-Asynchronous Mode - R/$\overline{W}$ - Read/Write Operation Identification Input Pin:** This pin is functionally equivalent to the "R/$\overline{W}$" input pin. In the Motorola Mode, a "READ" operation occurs if this pin is held at a logic "1", coincident to a falling edge of the RD/$\overline{DS}$ (Data Strobe) input pin. Similarly a WRITE operation occurs if this pin is at a logic "0", coincident to a falling edge of the RD/$\overline{DS}$ (Data Strobe) input pin.

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{WR}$	M23	L20	I	-	**(Con't)** **Power PC 403 Mode - R/$\overline{W}$ - Read/Write Operation Identification Input:** This input pin will function as the "Read/Write Operation Identification Input" pin. Anytime the Microprocessor Interface samples this input signal at a logic "High" (while also sampling the $\overline{CS}$ input pin "Low") upon the rising edge of PCLK, then the Microprocessor Interface will (upon the very same rising edge of PCLK) latch the contents of the Address Bus (A[14:0]) into the Microprocessor Interface circuitry, in preparation for this forthcoming READ operation. At some point (later in this READ operation) the Microprocessor will also assert the $\overline{DBEN/OE}$ input pin, and the Microprocessor Interface will then place the contents of the "target" register (or address location within the XRT86VL38 device) upon the Bi-Directional Data Bus pins (D[7:0]), where it can be read by the Microprocessor. Anytime the Microprocessor Interface samples this input signal at a logic "Low" (while also sampling the $\overline{CS}$ input pin a logic "Low") upon the rising edge of PCLK, then the Microprocessor Interface will (upon the very same rising edge of PCLK) latch the contents of the Address Bus (A[14:0]) into the Microprocessor Interface circuitry, in preparation for the forthcoming WRITE operation. At some point (later in this WRITE operation) the Microprocessor will also assert the $\overline{RD/DS/WE}$ input pin, and the Microprocessor Interface will then latch the contents of the Bi-Directional Data Bus (D[7:0]) into the contents of the "target" register or buffer location (within the XRT86VL38).

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{ACK0}$	Y23	W22	I	-	**DMA Cycle Acknowledge Input—DMA Controller 0 (Write):** The external DMA Controller will assert this input pin "Low" when the following two conditions are met: **1.** After the DMA Controller, within the Framer has asserted (toggled "Low"), the Req_0 output signal. **2.** When the external DMA Controller is ready to transfer data from external memory to the selected Transmit HDLC buffer. At this point, the DMA transfer between the external memory and the selected Transmit HDLC buffer may begin. After completion of the DMA cycle, the external DMA Controller will negate this input pin after the DMA Controller within the Framer has negated the $\overline{Req\_0}$ output pin. The external DMA Controller must do this in order to acknowledge the end of the DMA cycle.
$\overline{ACK1}$	Y24	V21			**DMA Cycle Acknowledge Input—DMA Controller 1 (Read):** The external DMA Controller asserts this input pin "Low" when the following two conditions are met: **1.** After the DMA Controller, within the Framer has asserted (toggled "Low"), the Req_1 output signal. **2.** When the external DMA Controller is ready to transfer data from the selected Receive HDLC buffer to external memory. At this point, the DMA transfer between the selected Receive HDLC buffer and the external memory may begin. After completion of the DMA cycle, the external DMA Controller will negate this input pin after the DMA Controller within the Framer has negated the $\overline{Req\_1}$ output pin. The external DMA Controller will do this in order to acknowledge the end of the DMA cycle. ***NOTE:*** *This pin is internally pulled "High" with a 50kΩ resistor.*

MICROPROCESSOR INTERFACE

SIGNAL NAME	420 PKG BALL#	484PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{\text{BLAST}}$	P23	M17	I	-	**Last Cycle of Burst Indicator Input:** If the Microprocessor Interface is operating in the Intel-I960 Mode, then this input pin is used to indicate (to the Microprocessor Interface block) that the current data transfer is the last data transfer within the current burst operation. The Microprocessor should assert this input pin (by toggling it "Low") in order to denote that the current READ or WRITE operation (within a BURST operation) is the last operation of this BURST operation. ***NOTES:*** *1. If the user has configured the Microprocessor Interface to operate in the Intel-Asynchronous, the Motorola-Asynchronous or the Power PC 403 Mode, then he/she should tie this input pin to GND.* *2. This pin is internally pulled "High" with a 50kΩ resistor.*
$\overline{\text{RESET}}$	Y4	Y1	I	-	**Hardware Reset Input** $\overline{\text{Reset}}$ is an active low input. If this pin is pulled "Low" for more than 10µS, the device will be reset. When this occurs, all output will be 'tri-stated', and all internal registers will be reset to their default values.

REVISION HISTORY

REVISION #	DATE	DESCRIPTION
V1.2.0	January 29, 2007	Released to production.

NOTICE

Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
