

64-Channel Serial to Parallel Converter with P-Channel Open Drain Controllable Output Current

Features

- ▶ HVCMOS® technology
- ▶ 5.0V CMOS Logic
- ▶ Output voltage up to -85V
- ▶ Output current source control
- ▶ 16MHz equivalent data rate
- ▶ Latched data outputs
- ▶ Forward and reverse shifting options (DIR pin)
- ▶ Diode to VDD allows efficient power recovery
- ▶ Hi-Rel processing available

General Description

The HV57009 is a low-voltage serial to high-voltage parallel converter with P-channel open drain outputs. This device has been designed for use as a driver for plasma panels.

The device has two parallel 32-bit shift registers, permitting data rates twice the speed of one (they are clocked together). There are also 64 latches and control logic to perform the blanking of the outputs. HV_{OUT}1 is connected to the first stage of the first shift register through the blanking logic. Data is shifted through the shift registers on the logic low to high transition of the clock. The DIR pin causes CCW shifting when connected to VSS, and CW shifting when connected to VDD. A data output buffer is provided for cascading devices. This output reflects the current status of the last bit of the shift register (HV_{OUT}64). Operation of the shift register is not affected by the LE (latch enable), or the BL (blanking) inputs. Transfer of data from the shift registers to latches occurs when the LE input is high. The data in the latches is stored when LE is low.

The HV570 has 64 channels of output constant current sourcing capability. They are adjustable from 0.1 to 2.0mA through one external resistor or a current source.

Absolute Maximum Ratings

Parameter	Value
Supply voltage, V_{DD}^1	-0.5V to +7.5V
Output voltage, V_{NN}^1	$V_{DD} + 0.5V$ to -95V
Logic input levels ¹	-0.3V to $V_{DD} + 0.3V$
Ground current ²	1.5A
Continuous total power dissipation ³	1200mW
Operating temperature range	-40°C to +85°C
Storage temperature range	-65°C to +150°C
Lead temperature ⁴	260°C

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability.

Notes:

- All voltages are referenced to V_{SS} .
- Duty cycle is limited by the total power dissipated in the package.
- For operation above 25°C ambient derate linearly to maximum operating temperature at 20mW/°C.
- 1.6mm (1/16inch) from case for 10 seconds

T_A	Operating free-air temperature	-40	+85	°C

Notes:

Power-up sequence should be the following:

- Connect ground
- Apply V_{DD}
- Set all inputs to a known state

Power-down sequence should be the reverse of the above.

Typical Current Programming Circuits

Figure 1a: Negative Control

*Required if $R_{EXT} > 10K\Omega$ or R_{EXT} is replaced by a constant current source.

Figure 1b: Positive Control

$$\text{Since } I_{OUT} = I_{REF} = |V_{REF}| / R_{EXT}$$

Therefore:

$$\begin{aligned} \text{If } I_{OUT} = 2.0\text{mA and } V_{REF} = -5.0\text{V} \rightarrow R_{EXT} = 2.5K\Omega. \\ \text{If } I_{OUT} = 1.0\text{mA and } R_{EXT} = 1.0K\Omega \rightarrow V_{REF} = -1.0\text{V}. \end{aligned}$$

If $R_{EXT} > 10K\Omega$, add series network R_D and C_D to ground for stability as shown.

This control method behaves linearly as long as the operational amplifier is not saturated. However, it requires a negative power source and needs to provide a current $I_{REF} = I_{OUT}$ for each HV570 chip being controlled.

If $HV_{OUT} \geq +1.0\text{V}$, the HV_{OUT} cascade may no longer operate as a perfect current source, and the output current will diminish. This effect depends on the magnitude of the output current.

Given I_{OUT} and V_{REF} , the R_{EXT} can be calculated by using:

$$R_{EXT} = V_{REF} / I_{OUT} = V_{REF} / I_{OUT}$$

The intersection of a set of I_{OUT} and V_{REF} values can be located in the graph shown below. The value picked for R_{EXT} must always be in the shaded area for linear operation. This control method has the advantage that V_{REF} is positive, and draws only leakage current. If $R_{EXT} > 10K\Omega$, add series network R_D and C_D to ground for stability as shown.

Note:

Lower reference current I_{REF} results in higher distortion, ΔI_{CS} , on the output.

Notes:

1. Pin designation for DIR = VDD.
2. A 0.1 μ F capacitor is needed between VDD and VBP (pin 40) for better output current stability and to prevent transient cross-coupling between outputs. See Figures 1a and 1b.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.
