# Precision, Very Low Noise, Low Input Bias Current Operational Amplifiers

Data Sheet

# AD8671/AD8672/AD8674

## FEATURES

**Very low noise: 2.8 nV/√Hz, 77 nV p-p**
**Wide bandwidth: 10 MHz**
**Low input bias current: 12 nA max**
**Low offset voltage: 75 µV max**
**High open-loop gain: 120 dB min**
**Low supply current: 3 mA typ per amplifier**
**Dual-supply operation: ±5 V to ±15 V**
**Unity-gain stable**
**No phase reversal**

## APPLICATIONS

**PLL filters**
**Filters for GPS**
**Instrumentation**
**Sensors and controls**
**Professional quality audio**

## GENERAL DESCRIPTION

The AD8671/AD8672/AD8674 are very high precision amplifiers featuring very low noise, very low offset voltage and drift, low input bias current, 10 MHz bandwidth, and low power consumption. Outputs are stable with capacitive loads of over 1000 pF. Supply current is less than 3 mA per amplifier at 30 V.

The AD8671/AD8672/AD8674's combination of ultralow noise, high precision, speed, and stability is unmatched. The MSOP version of the AD8671/AD8672 requires only half the board space of comparable amplifiers.

Applications for these amplifiers include high quality PLL filters, precision filters, medical and analytical instrumentation, precision power supply controls, ATE, data acquisition, and precision controls as well as professional quality audio.

The AD8671/AD8672 are specified over the extended industrial temperature range (−40°C to +125°C), and the AD8674 is specified over the industrial temperature range (−40°C to +85°C).

The AD8671/AD8672 are available in the 8-lead SOIC and 8-lead MSOP packages. The AD8674 is available in 14-lead SOIC and 14-lead TSSOP packages.

Surface-mount devices in MSOP packages are available in tape and reel only.

## PIN CONFIGURATIONS

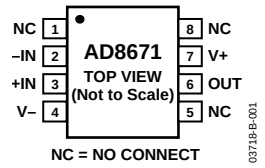

*Figure 1. 8-Lead SOIC_N (R-8) and 8-Lead MSOP (RM-8)*

# ABSOLUTE MAXIMUM RATINGS

**Table 4.**[1]

| Parameter | Rating |
|---|---|
| Supply Voltage | 36 V |
| Input Voltage | $V_S-$ to $V_S+$ |
| Differential Input Voltage | ±0.7 V |
| Output Short-Circuit Duration | Indefinite |
| Storage Temperature Range | |
| All Packages | −65°C to +150°C |
| Operating Temperature Range | |
| 8-Lead Packages | −40°C to +125°C |
| 14-Lead Packages | −40°C to +85°C |
| Junction Temperature Range | |
| All Packages | −65°C to +150°C |
| Lead Temperature Range (Soldering, 60 sec) | 300°C |

[1] Absolute maximum ratings apply at 25°C, unless otherwise noted.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

See the Applications section for a related discussion on power.

**Table 5. Package Characteristics**

| Package Type | $\theta_{JA}$[1] | $\theta_{JC}$ | Unit |
|---|---|---|---|
| 8-Lead MSOP (RM) | 142 | 44 | °C/W |
| 8-Lead SOIC_N (R) | 120 | 43 | °C/W |
| 14-Lead SOIC_N (R) | 90 | 36 | °C/W |
| 14-Lead TSSOP (RU) | 112 | 35 | °C/W |

[1] $\theta_{JA}$ is specified for the worst-case conditions, that is., $\theta_{JA}$ is specified for the device soldered on a 4-layer circuit board for surface-mount packages.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

# APPLICATIONS

## POWER DISSIPATION CALCULATIONS

To achieve low voltage noise in a bipolar op amp, the current must be increased. The emitter-base theoretical voltage noise is approximately

$$e_n = 10^9 kT\sqrt{\frac{2}{qI_C}}\ \text{nV}/\sqrt{\text{Hz}}$$

To achieve the low voltage noise of 2.8 nV/√Hz, the input stage current is higher than most op amps with an equivalent gain bandwidth product. The thermal noise of a 1 kΩ resistor is 4 nV/√Hz, which is higher than the voltage noise of AD8671 family. Low voltage noise requires using low values of resistors, so low voltage noise op amps should have good drive capability, such as a 600 Ω load. This means that the second stage and output stage are also biased at higher currents. As a result, the supply current of a single op amp is 3.5 mA maximum at room temperature.

Junction temperature has a direct affect on reliability. For more information, visit the following Analog Devices, Inc., website: http://www.analog.com/en/quality-and-reliability/reliability-data/content/index.html

MTTF and FIT calculations can be done based on the junction temperature and IC process. Use the following equation to determine the junction temperature:

$$T_J = T_A + P_D \times \theta_{JA}$$

For the AD8671 single in the 8-lead MSOP package, the thermal resistance, $\theta_{JA}$, is 142°C/W. If the ambient temperature is 30°C and the supply voltages are ±12 V, the power dissipation is

24 V × 3.5 mA = 84 mW

Therefore, the rise above ambient temperature is

84 mW × 142°C/W = 12°C

If the ambient temperature is 30°C, the junction temperature is 42°C. The previously mentioned website that details the effect of the junction temperature on reliability has a calculator that requires only the part number and the junction temperature to determine the process technology.

For the AD8674 single in the 14-Lead TSSOP package, the thermal resistance, $\theta_{JA}$, is 112°C/W. Although $\theta_{JA}$ is lower than it is for the 8-lead package, the four op amps are powered simultaneously. If the ambient temperature is 50°C and the supply voltages are ±15 V, the power dissipation is

30 V × 4.2 mA × four op amps = 504 mW

Therefore, the rise above ambient temperature is

504 mW × 112°C/W = 56°C

With an ambient temperature of 50°C, the junction temperature is 106°C. This is less than the specified absolute maximum junction temperature, but for systems with long product lifetimes (years), this should be considered carefully.

Note that these calculations do not include the additional dissipation caused by the load current on each op amp. Possible solutions to reduce junction temperature include system level considerations such as fans, Peltier thermoelectric coolers, and heat pipes. Board considerations include operation on lower voltages, such as ±12 V or ±5 V, and using two dual op amps instead of one quad op amp. If the extremely low voltage noise and high gain bandwidth is not required, using other quad op amps, such as ADA4091-4, OP4177, ADA4004-4, OP497, or AD704 can be considered.

## UNITY-GAIN FOLLOWER APPLICATIONS

When large transient pulses (>1 V) are applied at the positive terminal of amplifiers (such as the OP27, LT1007, OPA227, and AD8671) with back-to-back diodes at the input stage, the use of a resistor in the feedback loop is recommended to avoid having the amplifier load the signal generator. The feedback resistor, $R_F$, should be at least 500 Ω. However, if large values must be used for $R_F$, a small capacitor, $C_F$, should be inserted in parallel with $R_F$ to compensate for the pole introduced by the input capacitance and $R_F$.

Figure 30 shows the uncompensated output response with a 10 kΩ resistor in the feedback and the compensated response with $C_F$ = 15 pF.

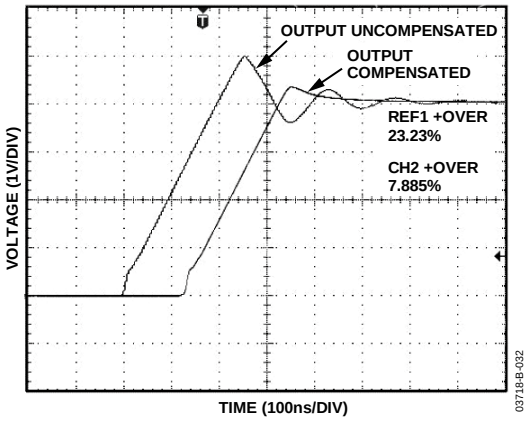

*Figure 30. Transient Output Response*

## OUTPUT PHASE REVERSAL

Phase reversal is a change of polarity in the amplifier transfer function that occurs when the input voltage exceeds the supply voltage. The AD8671/AD8672/AD8674 do not exhibit phase reversal even when the input voltage is 1 V beyond the supplies.

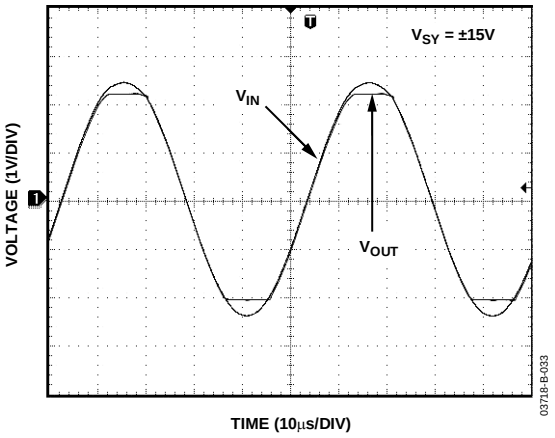

*Figure 31. Output Phase Reversal*

## TOTAL NOISE VS. SOURCE RESISTANCE

The low input voltage noise of the AD8671/AD8672/AD8674 makes them a great choice for applications with low source resistance. However, because they have low input current noise, they can also be used in circuits with substantial source resistance.

Figure 32 shows the voltage noise, current noise, thermal noise, and total rms noise of the AD8671 as a function of the source resistance.

For $R_S$ < 475 Ω, the input voltage noise, $e_n$, dominates.
For 475 Ω < $R_S$ < 412 kΩ, thermal noise dominates.
For $R_S$ > 412 kΩ, the input current noise dominates.

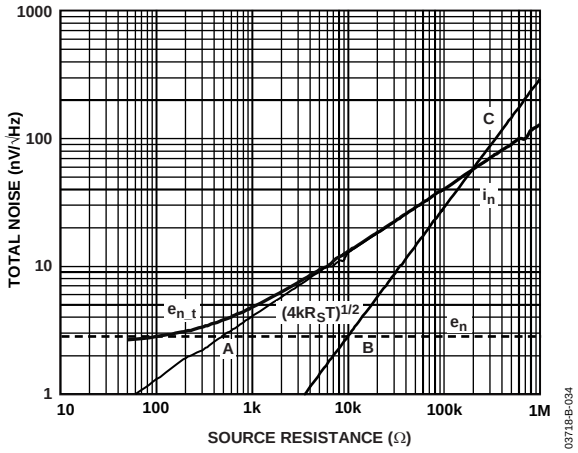

*Figure 32. Noise vs. Source Resistance*

## TOTAL HARMONIC DISTORTION (THD) AND NOISE

The AD8671/AD8672/AD8674 exhibit low total harmonic distortion (THD) over the entire audio frequency range. This makes them suitable for applications with high closed-loop gains, including audio applications. Figure 33 shows approximately 0.0006% of THD + N in a positive unity gain, the worst-case configuration for distortion.

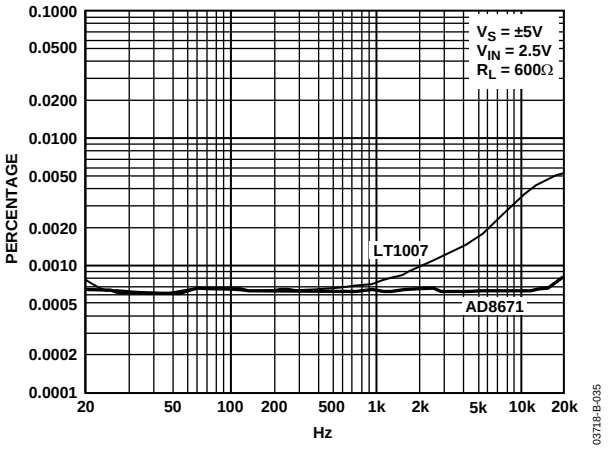

*Figure 33. Total Harmonic Distortion and Noise*

## DRIVING CAPACITIVE LOADS

The AD8671/AD8672/AD8674 can drive large capacitive loads without causing instability. However, when configured in unity gain, driving very large loads can cause unwanted ringing or instability.

Figure 34 shows the output of the AD8671 with a capacitive load of 1 nF. If heavier loads are used in low closed-loop gain or unity-gain configurations, it is recommended to use external compensation as shown in the circuit in Figure 35. This technique reduces the overshoot and prevents the op amp from oscillation. The trade-off of this circuit is a reduction in output swing. However, a great added benefit stems from the fact that the input signal and the op amp's noise are filtered, and thus the overall output noise is kept to a minimum.

The output response of the circuit is shown in Figure 36.

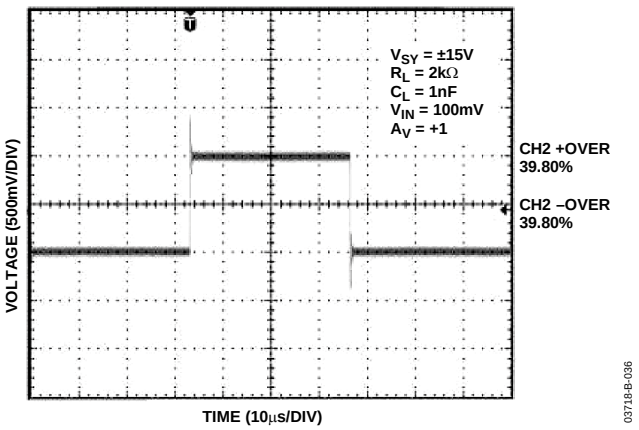

*Figure 34. AD8671 Capacitive Load Drive*

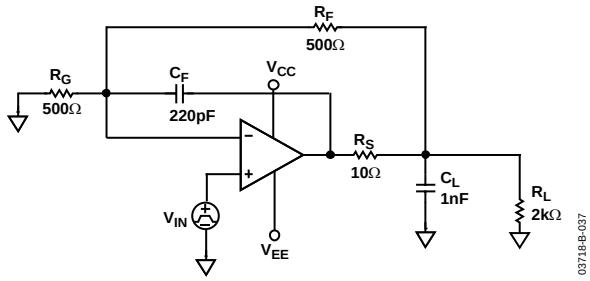

*Figure 35. Recommended Capacitive Load Circuit*

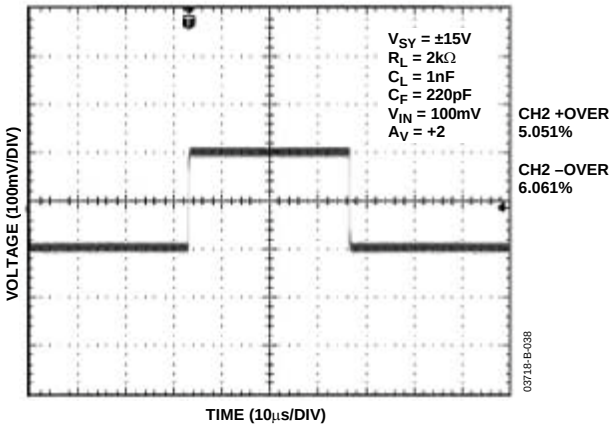

*Figure 36. Compensated Load Drive*

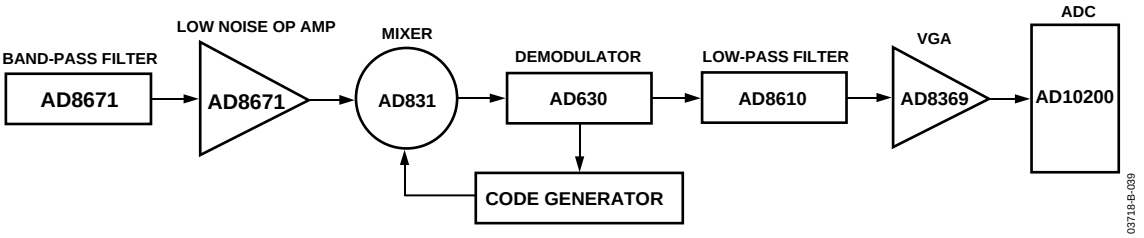

*Figure 37. Simplified Block Diagram of a GPS Receiver*

## GPS RECEIVER

GPS receivers require low noise to minimize RF effects. The precision of the AD8671 makes it an excellent choice for such applications. Its very low noise and wide bandwidth make it suitable for band-pass and low-pass filters without the penalty of high power consumption.

Figure 37 shows a simplified block diagram of a GPS receiver. The next section details the design equations.

## BAND-PASS FILTER

Filters are useful in many applications; for example, band-pass filters are used in GPS systems, as discussed in the previous section. Figure 38 shows a second-order band-pass KRC filter.

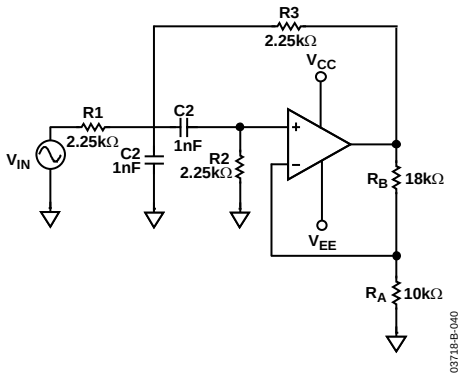

*Figure 38. Band-Pass KRC Filter*

The equal component topology yields a center frequency

$$fo = \frac{\sqrt{2}}{2\pi RC}$$

$$\text{and } Q = \frac{\sqrt{2}}{4-K}$$

where:

$$K = 1 + \frac{R_B}{R_A}$$

The band-pass response is shown in Figure 39.

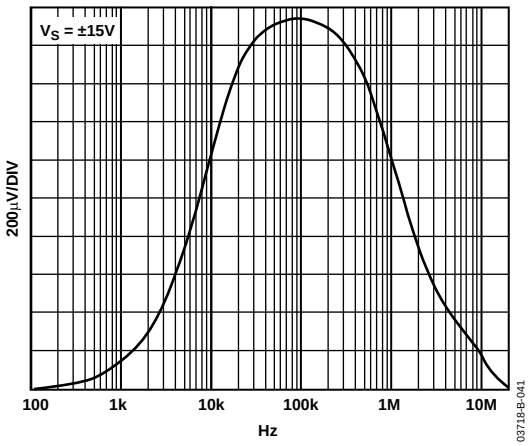

*Figure 39. Band-Pass Response*

## PLL SYNTHESIZERS AND LOOP FILTERS

Phase-lock loop filters are used in AM/FM modulation.

Loop filters in PLL design require accuracy and care in their implementation. The AD8671/AD8672/AD8674 are ideal candidates for such filter design; the low offset voltage and low input bias current minimize the output error. In addition to the excellent dc specifications, the AD8671/AD8672/AD8674 have a unique performance at high frequencies; the high open-loop gain and wide bandwidth allow the user to design a filter with a high closed-loop gain if desirable. To optimize the filter design, it is recommended to use small value resistors to minimize the thermal noise. A simple example is shown in Figure 40.

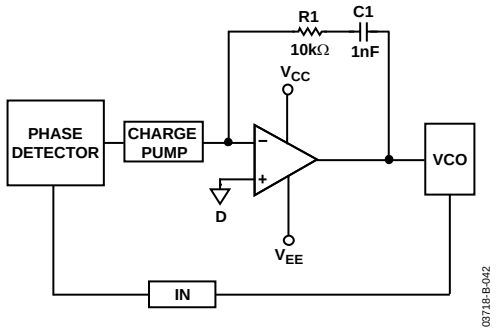

*Figure 40. PLL Filter Simplified Block Diagram*

Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
