### Functional Diagram

### General Description

The HMC699LP5(E) is a frequency synthesizer with a wideband reversible polarity digital PFD and lock detect output. The divider operates from 160 - 7000 MHz with a continuous integer division ratio N = 56 to 519 and non-continuous division ratio N = 16 to 54. The HMC699LP5(E) high frequency operation along with ultra low phase noise floor make possible synthesizers with wide loop bandwidth and low N resulting in fast settling and very low phase noise. When used in conjunction with a differential loop filter, the HMC699LP5(E) can be used to phase lock a VCO to a reference oscillator. For continuous division ratio, the A counter and S counter must satisfy the condition:  $A + 1 \geq S$ .

## 7 GHz INTEGER N SYNTHESIZER CONTINUOUS (N = 56 - 519), NON-CONTINUOUS (N = 16 - 54)

### HMC699LP5(E) Programming

The decimal value of A counter and S counter can be defined as:

$$A = \text{int} \left( \frac{N}{8} \right) - 1$$

and  $S = N - 8 (A + 1)$

where  $N = 16$  to  $519$

For a valid division ratio N, the A counter and S counter must satisfy the condition:  $A + 1 \geq S$

Therefore,  $N = 16$  to  $54$  will result into non-continuous division ratio

and  $N = 56$  to  $519$  will be continuous division ratio.

Example: Given a reference frequency,  $F_{\text{ref}} = 11$  MHz, and VCO output frequency,  $F_{\text{vco}} = (198 \text{ to } 297)$  MHz, results in  $N = 18$  to  $27$ . The decimal value of A counter and S counter for  $N = 18$  will be:

$$A = \text{int} \left( \frac{18}{8} \right) - 1 = 1$$

and  $S = 18 - 8 (1 + 1) = 2$

Since the calculated value of A and S satisfy the condition of  $A + 1 \geq S$ , the  $N = 18$  is usable division ratio.

The division ratio,  $N = 23$ , however, will result in  $A = 1$  and  $S = 7$ . Under the condition  $A + 1 \geq S$ , the division ratio  $N = 23$  is not usable.

In this example, the division ratio,  $N = 19$  to  $23$  cannot be programmed and therefore, the frequency range of  $209$  MHz to  $253$  MHz cannot be used.

## Evaluation PCB

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package backside ground paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
