Introduction

This document describes the features and hardware details of the CPU Board XMC4500 General Purpose (CPU_45A-V3) designed to work with Infineon's XMC4500 Microcontroller. This board is part of Infineon's XMC4000 Application Kits.

1 Overview

The CPU board CPU_45A-V3 houses the XMC4500 Microcontroller and three satellite connectors (HMI, COM, ACT) for application expansion. The board along with satellite cards (e.g. HMI_OLED-V1, COM_ETH-V1, AUT_ISO-V1, MOT_GPDLV-V boards) demonstrates the capabilities of XMC4500. The main use case for this board is to demonstrate the generic features of XMC4500 device including tool chain. The focus is safe operation under evaluation conditions. The board is neither cost nor size optimized and does not serve as a reference design.

1.1 Key Features

The CPU_45A-V3 board is equipped with the following features

- XMC4500 (ARM® Cortex™-M4-based) Microcontroller, 120 MHz CPU clock, 1 MByte on-chip Flash, 160 kByte RAM, LQFP-144,
- Connection to XMC4500 satellite cards via satellite connectors COM, HMI and ACT
- USB OTG Host/Device support via micro USB connector
- Debug options
  - On-board Debugger via Debug USB connector
  - Cortex Debug connector 10-pin (0.05")
  - Cortex Debug+ETM connector 20-pin (0.05")
- Reset push button
- 32 MBit quad SPI flash memory
- Boot option switch
- PowerScale Connector: Ready for MCU power consumption analysis
- 5 LED's
  - 3 Power indicating LED's
  - 1 User LEDs (P3.9)
  - 1 RESET LED
  - 1 Debug LED
- User Button connected to P2.15
- Potentiometer, connected to analog input P14.1
- Power supply
  - Via Micro-USB connector in USB device mode
  - Via satellite connector pins (COM/ACT satellites cards can supply power to CPU board)
  - Via Debug USB connector
  - RTC backup battery

1.2 Block Diagram

Figure 1 shows the functional block diagram of the CPU_45A-V3 board. For more information about the power supply please refer to chapter 2.1.

The CPU board has got the following building blocks:

- 3 Satellite Connectors (COM, HMI ACT)
- On-board Debugger via Debug USB connector (Micro-USB)
- User LED connected to P3.9
- User Button connected to P2.15
- Quad SPI flash memory (EE) connected to USIC1 Channel1 with Chip-Select1
- 2 Cortex Debug Connectors
- Variable resistor (POTI) connected to GPIO P14.1
- USB On-The-Go Connector (Micro-USB)

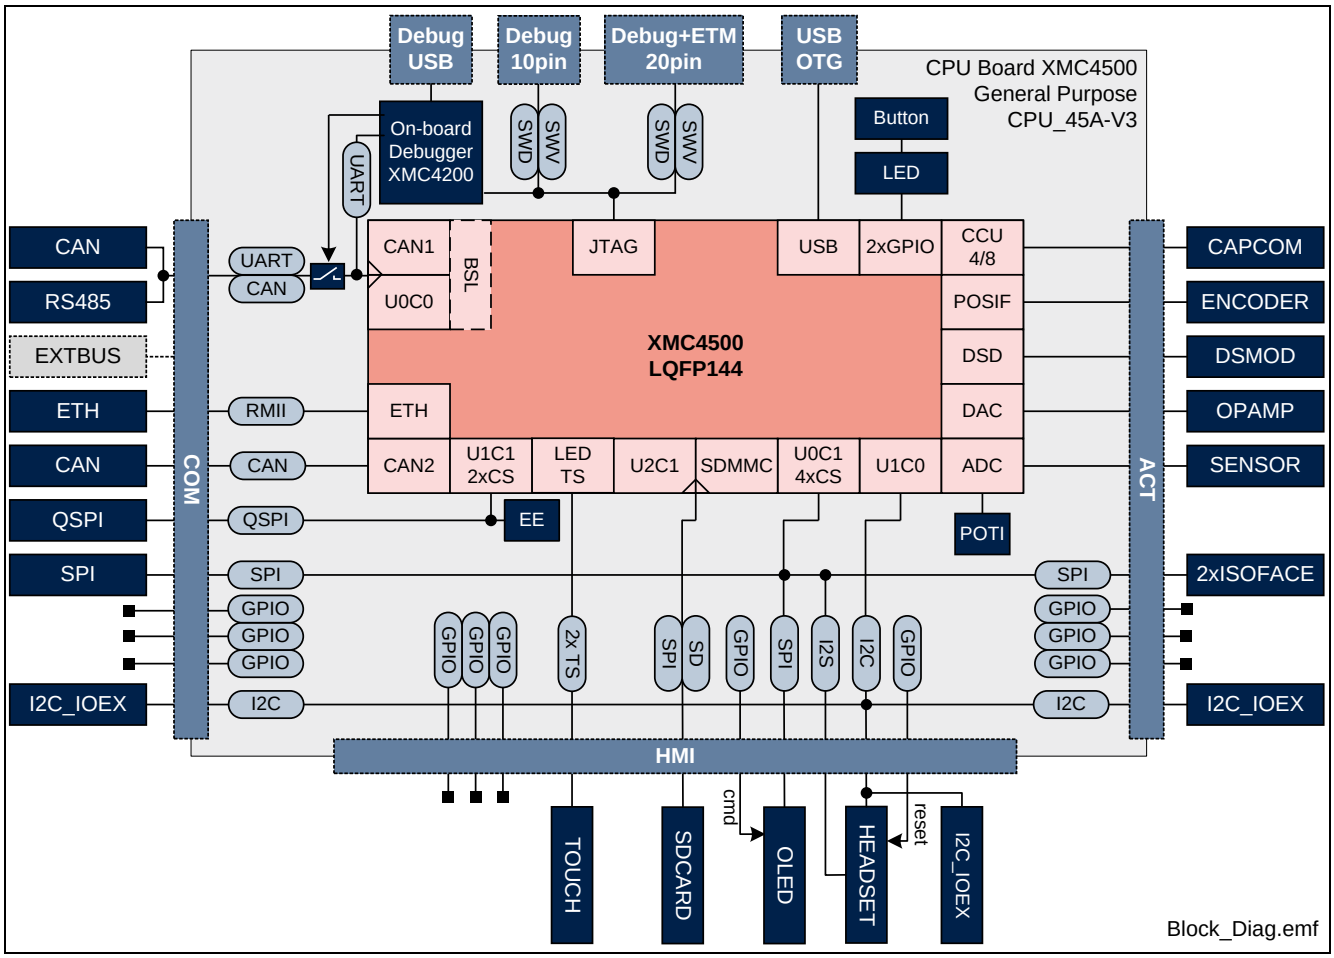

Figure 1 CPU_45A-V3 Board Block Diagram

2 Hardware Description

The following sections give a detailed description of the hardware and how it can be used.

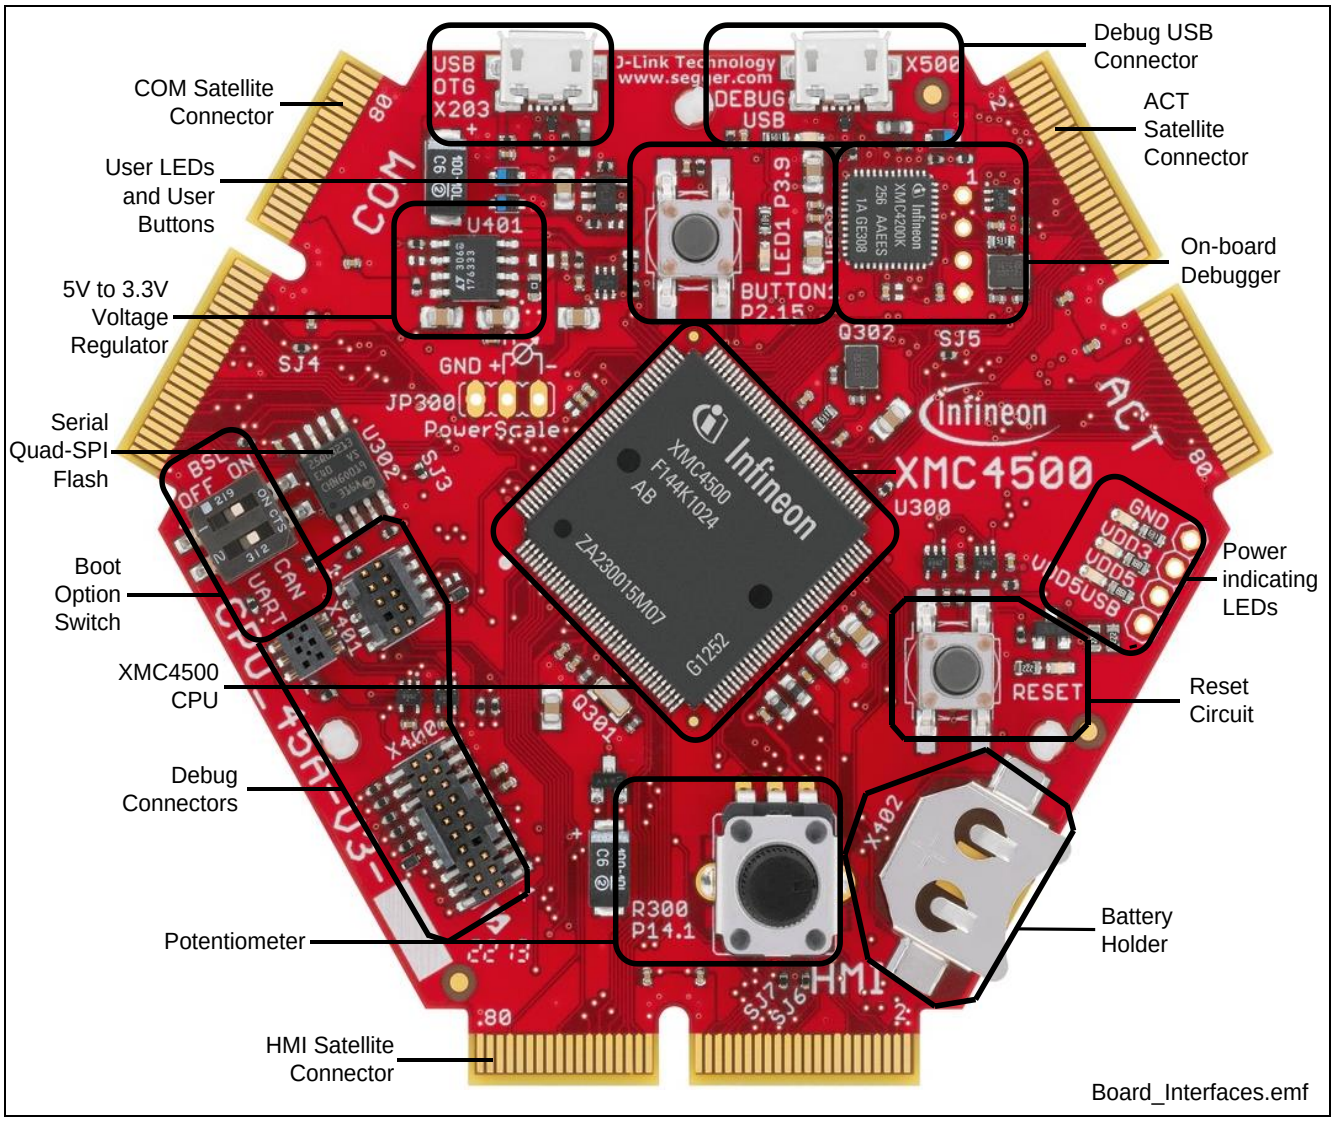

Figure 2 CPU Board XMC4500 General Purpose (CPU_45A-V3)

2.1 Power Supply

The CPU_45A-V3 board can be powered via the USB plug (5 V); however, there is a current limit that can be drawn from the host PC through USB. If the CPU_45A-V3 board is used to drive other satellite cards (e.g. AUT_ISO-V1 or MOT_GPDLV-V2) and the total current required exceeds 500 mA, then the board needs to be powered by either an external power supply connected to USB or by a satellite card, which supports external power supply like e.g. AUT_ISO-V1, MOT_GPDLV-V2, COM_ETH-V1.

For powering the board through USB interface, connect the USB cable provided with the kit to the Micro-USB connector on board.

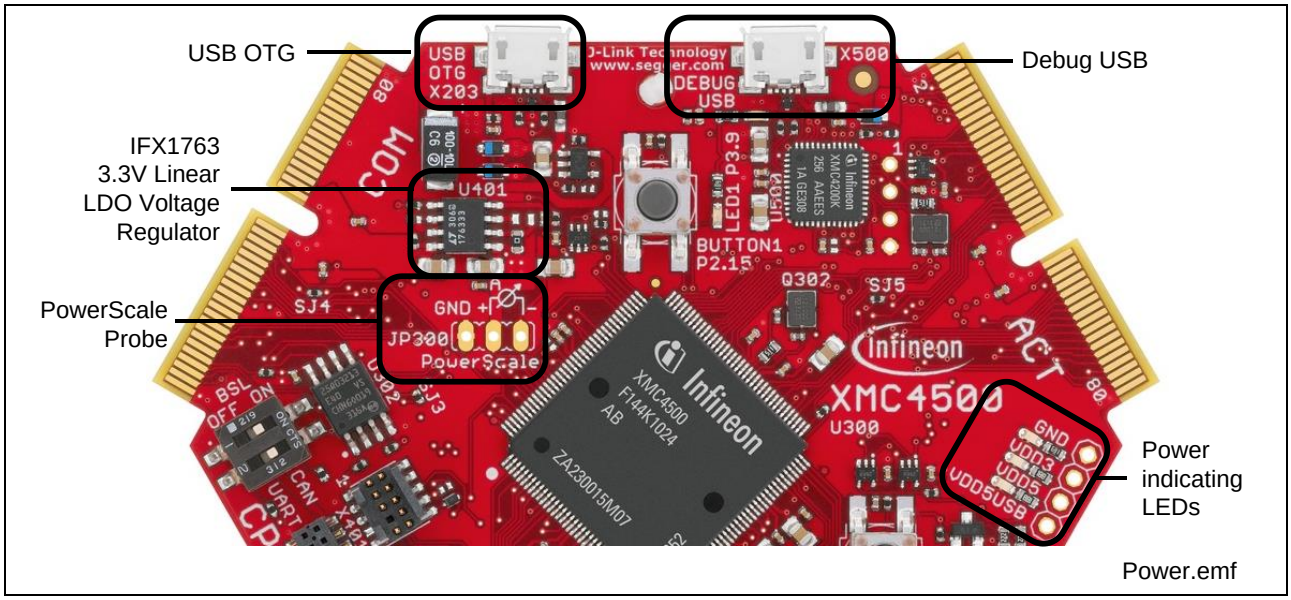

Figure 3 Powering option through USB interface (5 V)

To indicate the power status of CPU_45A-V3 board three LED's are provided on board (See Figure 3). The LED will be "ON" when the corresponding rail is powered.

Table 1 Power status LED's

LED Reference	Power Rail	Voltage	Note
V401	VDD5	5 V	Must always be "ON"
V402	VDD5USB	5 V	"ON" if powered by USB plug
V403	VDD3.3	3.3 V	Must always be "ON"

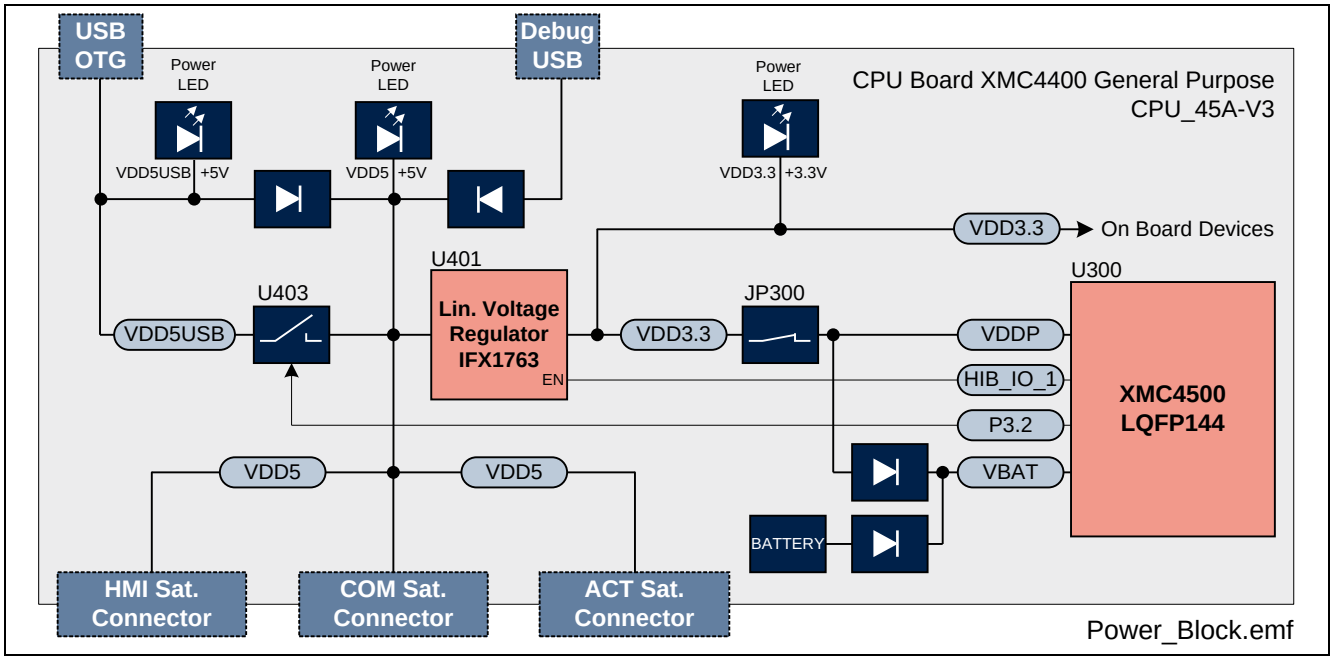

Figure 4 CPU_45A-V3 Board Power

Figure 5 Battery (VBAT Supply)

Hitex PowerScale probe is provided on the CPU_45A-V3 board to measure the power consumption.

Table 2 Power Measurement

Jumper	Function	Description
JP300	PowerScale	A Hitex PowerScale probe can be connected for current sensing the VDD3.3 (CPU power source). Default: pos. 1-2 (closed) *Note: On the PCB there is a shorting trace between pin 1-2. This trace has to be cut first, before using PowerScale. Pin 3 is GND.*

The maximum current drawn by the CPU board without any satellite cards connected is about 150 mA.

2.2 Reset

The reset pin (PORST#) of the XMC45000 is a bi-directional pin. An internal pull-up resistor will keep the PORST# pin high during normal operation. A low level at this pin will force a hardware reset. In case of an internal reset the PORST# pin will drive a low signal. An internal circuit of the XMC4500 ensures a save Power-on-Reset. XMC4500 does not require any additional external components to generate a reset signal during power-up. An on-board reset button (SW400, RESET) supports a hardware reset of the CPU during operation. The reset signal is also routed to all satellite connectors. The reset state is indicated by a red LED (V407). The LED will be “ON” during reset state and will be “OFF” during normal operation conditions.

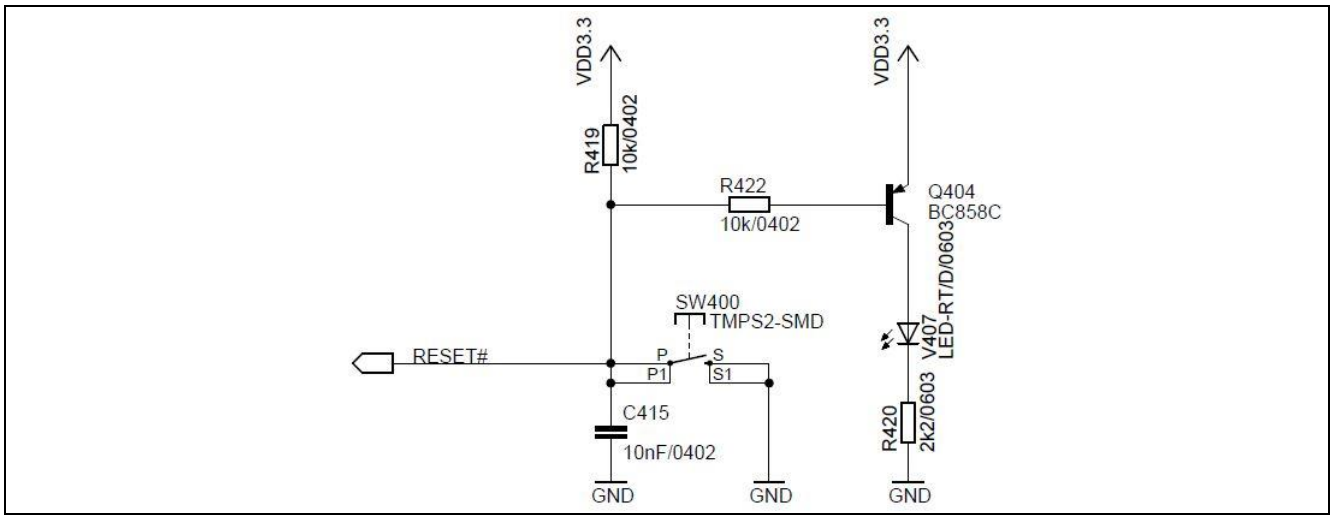

Figure 6 Reset

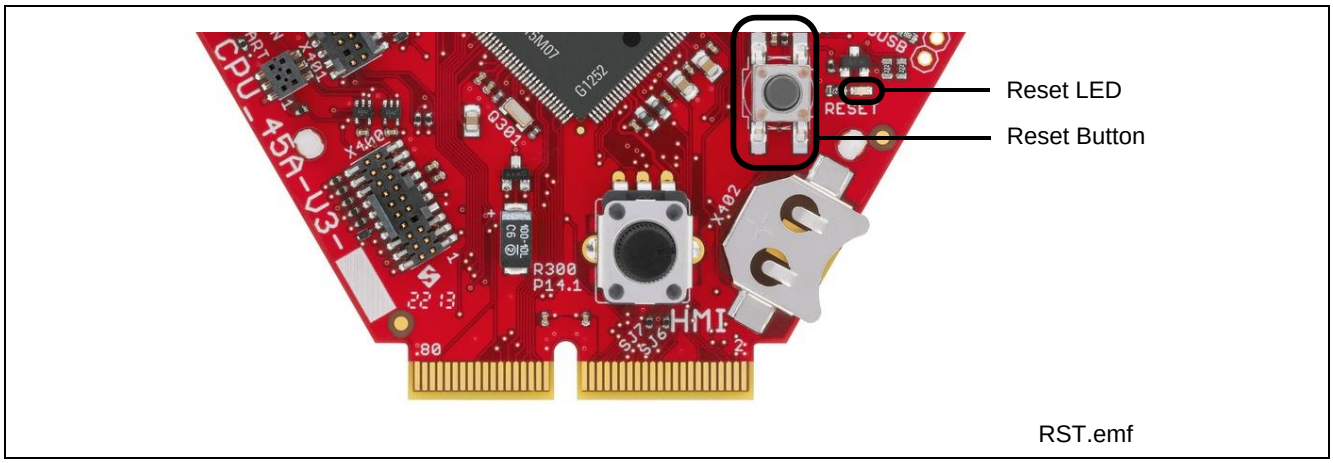

Figure 7 Reset LED and Reset Switch

2.3 Clock Generation

An external 12 MHz crystal provides the clock signal to the XMC4500 microcontroller. The drive strength of the oscillator is set to maximum by software, in order to ensure a safe start-up of the oscillator even under worst case conditions. A serial 510 Ohm resistor will attenuate the oscillations during operations.

For the RTC clock a separate external 32.768 kHz crystal is used on board.

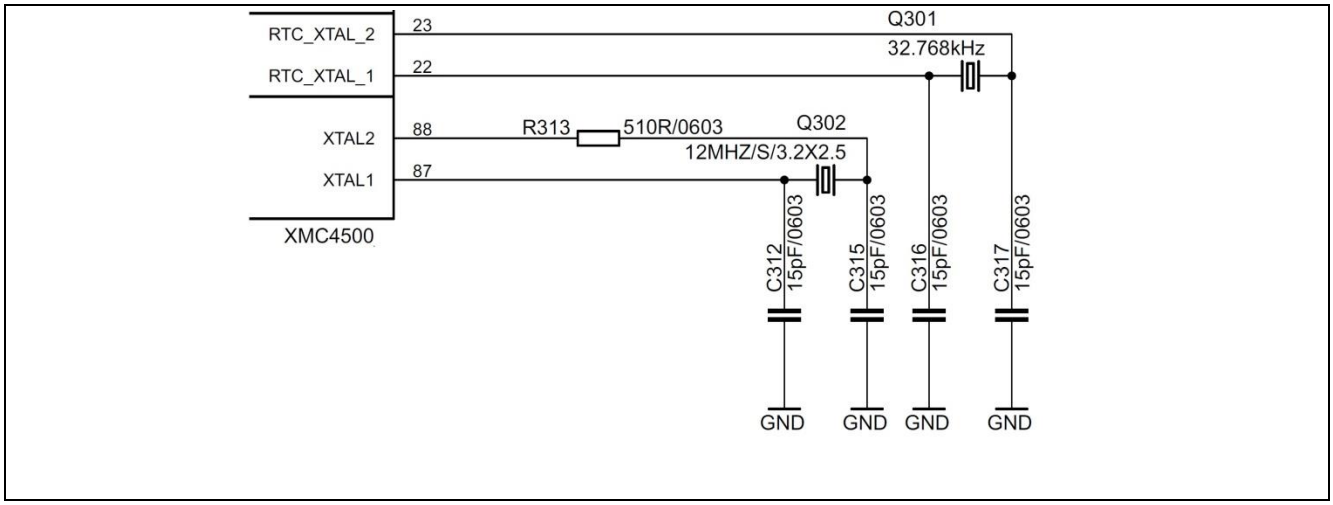

Figure 8 Clock Generation

2.4 Boot Option

During power-on-reset the XMC4500 latches the dip switch SW300 settings via the TCK and the TMS pin. Based on the values latched different boot options are possible.

Table 3 Boot Options Settings

BSL (TMS)	CAN/UART (TCK)	Boot Option
OFF (1)	UART (0)	Normal Mode (Boot from flash)
ON (0)	UART (0)	ASC BSL Enabled (Boot from UART)
OFF (1)	CAN (1)	BMI Customized Boot Enabled
ON (0)	CAN (1)	CAN BSL Enabled (Boot from CAN)

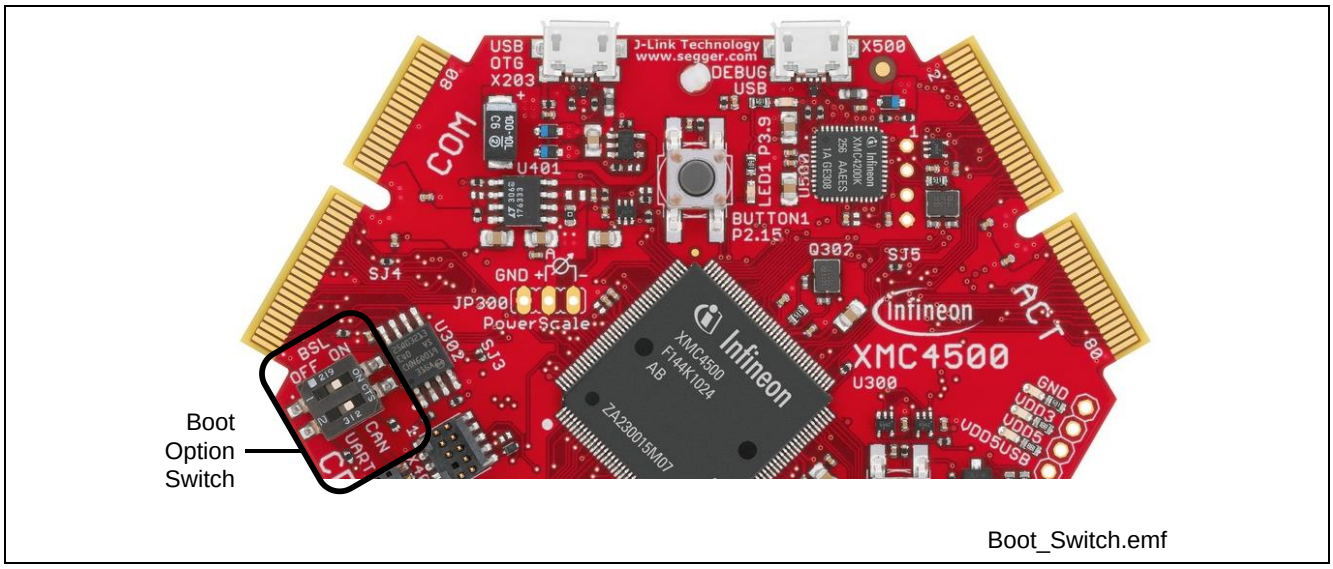

Figure 9 Boot Options Switch

2.5 Debug Interface

The CPU_45A-V3 board supports JTAG debug via 3 different connectors.

- On-board Debugger
- Cortex Debug Connector (10-pin)
- Cortex Debug+ETM Connector (20-pin)

The Hexagon Application Boards are designed to use “Serial Wire Debug” as debug interface. JTAG is not supported by default because the GPIO P0.7 (TDI), where the required TDI function is mapped to, is used by various Actuator boards connected to the ACT satellite connector.

Note: It is strongly recommended not to use JTAG debug mode, especially if satellites boards are connected, which uses the GPIO 0.7. For the same reason also do not use the on-board debugger in JTAG mode.

If you want to use the JTAG debug mode through the cortex debug connectors (X400, X401) anyway, enable the JTAG interface of the XMC device by assembling the pull-up resistor R427 (4k7 Ohm) and the resistor R410 (0 - 33 Ohm).

2.5.1 On-board USB Debugger

The on-board debugger supports

- Serial Wire Debug
- Serial Wire Viewer
- Full Duplex UART communication via a USB Virtual COM

The on-board debugger can be accessed through the Debug USB connector shown in Figure 10. The Debug LED V502 shows the status during debugging.

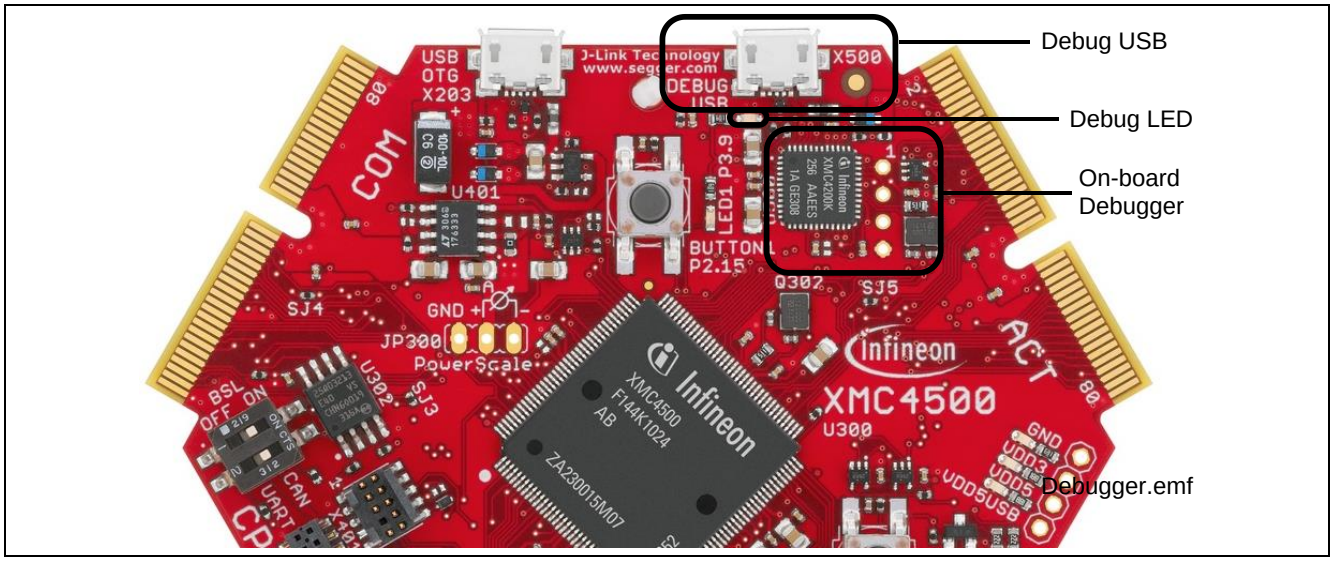

Figure 10 On-Board USB Debugger

When using an external debugger connected to the 10-pin/20-pin Cortex Debug Connector, the on-board debugger is switched off.

When using the USB virtual COM port function of the on-board debugger the UART interface to the COM satellite is disabled through the switches U301 and U303.

2.5.2 Cortex Debug Connector (10-pin)

The CPU_45A-V3 board supports Serial Wire debug operation and Serial Wire viewer operation (via the SWO signal when Serial Wire debug mode is used) through the 10-pin Cortex Debug Connector.

When using an external debugger connected to the 10-pin Cortex Debug Connector, the on-board debugger is switched off.

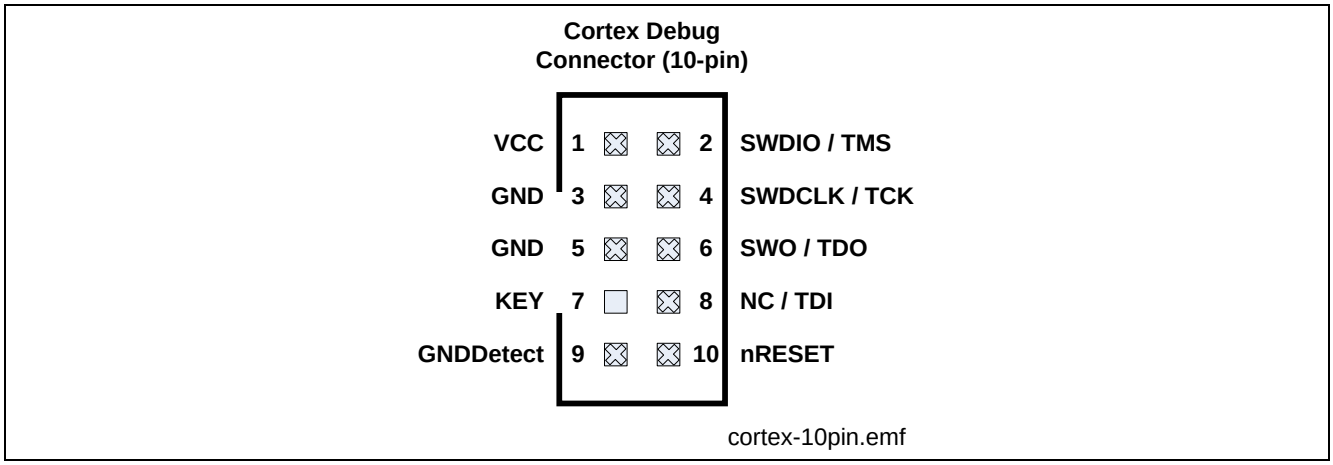

Figure 11 Cortex Debug Connector (10-pin)

Table 4 Cortex Debug Connector (10 Pin)

Pin No.	Signal Name	Serial Wire Debug	JTAG Debug
1	VCC	+3.3 V	+3.3 V
2	SWDIO / TMS	Serial Wire Data I/O	Test Mode Select
3	GND	Ground	Ground
4	SWDCLK / TCK	Serial Wire Clock	Test Clock
5	GND	Ground	Ground
6	SWO / TDO	Trace Data OUT	Test Data OUT
7	KEY	KEY	KEY
8	NC / TDI	Not connected	Test Data IN
9	GNDDetect	Ground Detect	Ground Detect
10	nRESET	Reset (Active Low)	Reset (Active Low)

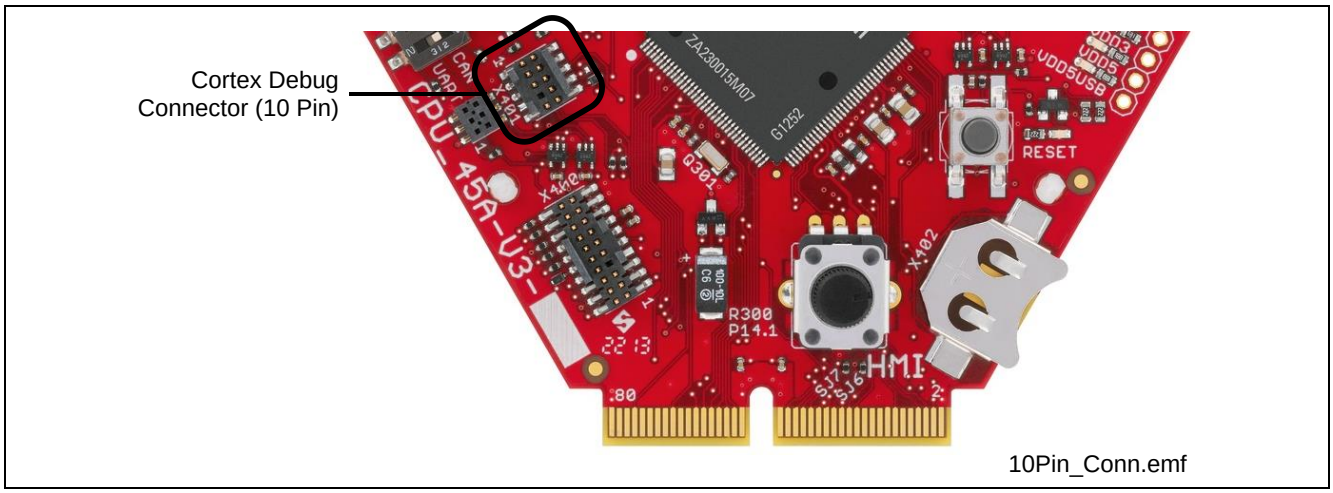

Figure 12 Cortex Debug Connector (10-pin) Layout

2.5.3 Cortex Debug+ETM Connector (20-pin)

The CPU_45A-V3 board supports Serial Wire debug operation, Serial Wire viewer operation (via SWO connection when Serial Wire debug mode is used) and Instruction Trace operation through the 20-pin Cortex Debug+ETM Connector.

JTAG operation additionally would require the TDI (P0.7) signal. By default the TDI signal is disconnected from the Cortex Debug Connectors by a not assembled resistor R410, because the pin P0.7 is used by the Actuator boards connected to the ACT satellite connector.

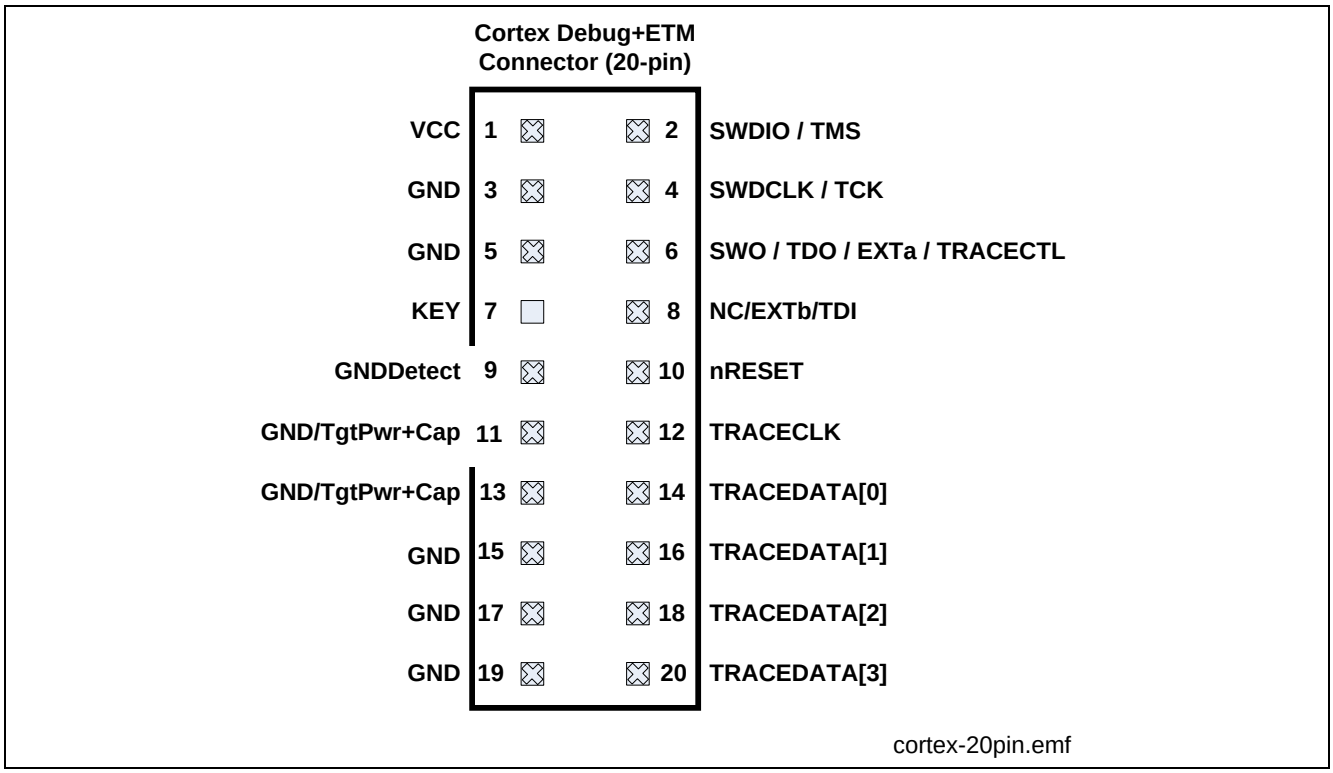

Figure 13 Cortex Debug+ETM Connector (20-pin)

Table 5 Cortex Debug+ETM Connector (20 Pin)

Pin No.	Signal Name	Serial Wire Debug	JTAG Debug
1	VCC	+3.3 V	+3.3 V
2	SWDIO / TMS	Serial Wire Data I/O	Test Mode Select
3	GND	Ground	Ground
4	SWDCLK / TCK	Serial Wire Clock	Test Clock
5	GND	Ground	Ground
6	SWO / TDO	Trace Data OUT	Test Data OUT
7	KEY	KEY	KEY
8	NC / TDI	Not connected	Test Data IN
9	GNDDetect	Ground Detect	Ground Detect
10	nRESET	Reset (Active Low)	Reset (Active Low)
11	GND/TgtPwr+Cap	Ground	Ground
12	TRACECLK	Trace Clock	Trace Clock
13	GND/TgtPwr+Cap	Ground	Ground
14	TRACEDATA[0]	Trace Data 0	Trace Data 0
15	GND	Ground	Ground

Table 5 Cortex Debug+ETM Connector (20 Pin)

Pin No.	Signal Name	Serial Wire Debug	JTAG Debug
16	TRACEDATA[1]	Trace Data 1	Trace Data 1

20	TRACEDATA[3]	Trace Data 3	Trace Data 3

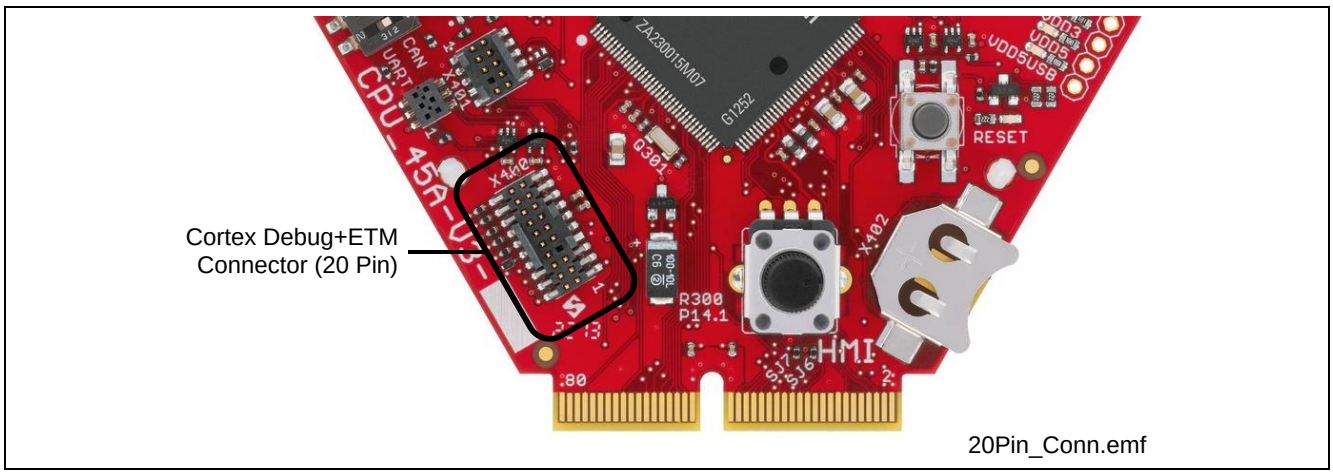

Figure 14 Cortex Debug+ETM Connector (20-pin) Layout

2.6 Serial Flash Memory

The CPU_45A-V3 board provides a 32 Mbit serial flash memory from Micron (type: N25Q03) interfaced to XMC4500 through a SPI interface. The SPI interface can be configured as single, dual or quad SPI.

Table 6 Quad SPI Signals

Pin No.	Pin Description	Signal Name	Signal Description
P0.13	U1C1_SCLKOUT	CLK	Clock
P3.3	U1C1_SELO1	CS#	Active Low Chip Select
P3.15	U1C1_DOUT0	DI (IO0)	Data Input/Output of Flash (MTSR/MOSI)
P3.14	U1C1_DX0B	DO (IO1)	Data Input/Output of Flash (MRST/MISO)
P0.14	U1C1_HOUT3/DWIN3	HOLD# (IO3)	Data Input/Output
P0.15	U1C1_HOUT2/DWIN2	WP# (IO2)	Data Input/Output

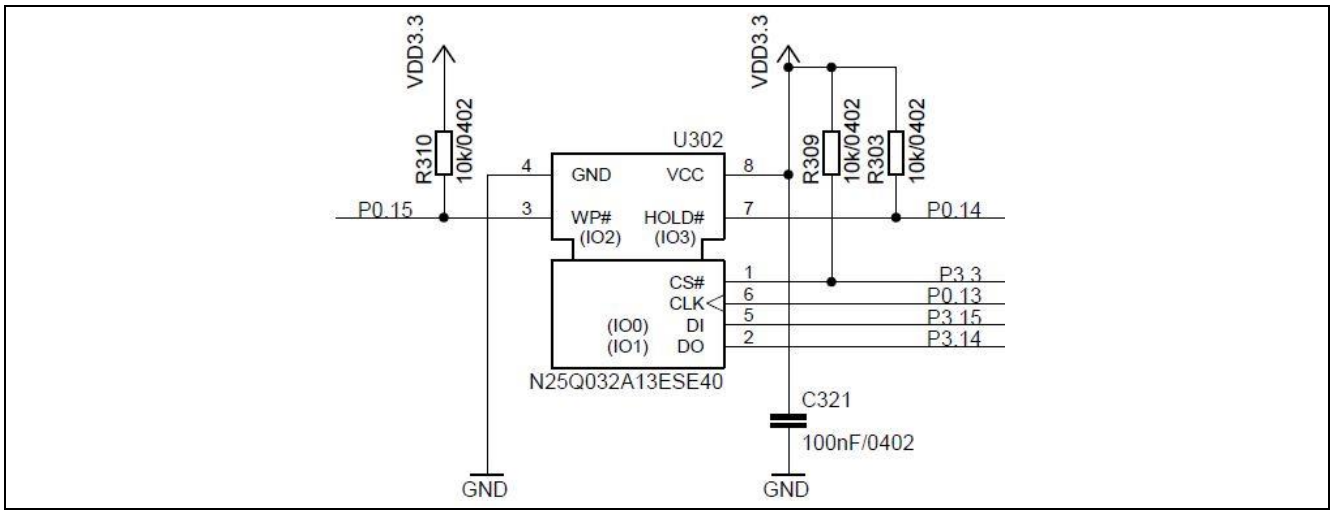

Figure 15 Quad SPI Flash Interface Circuit

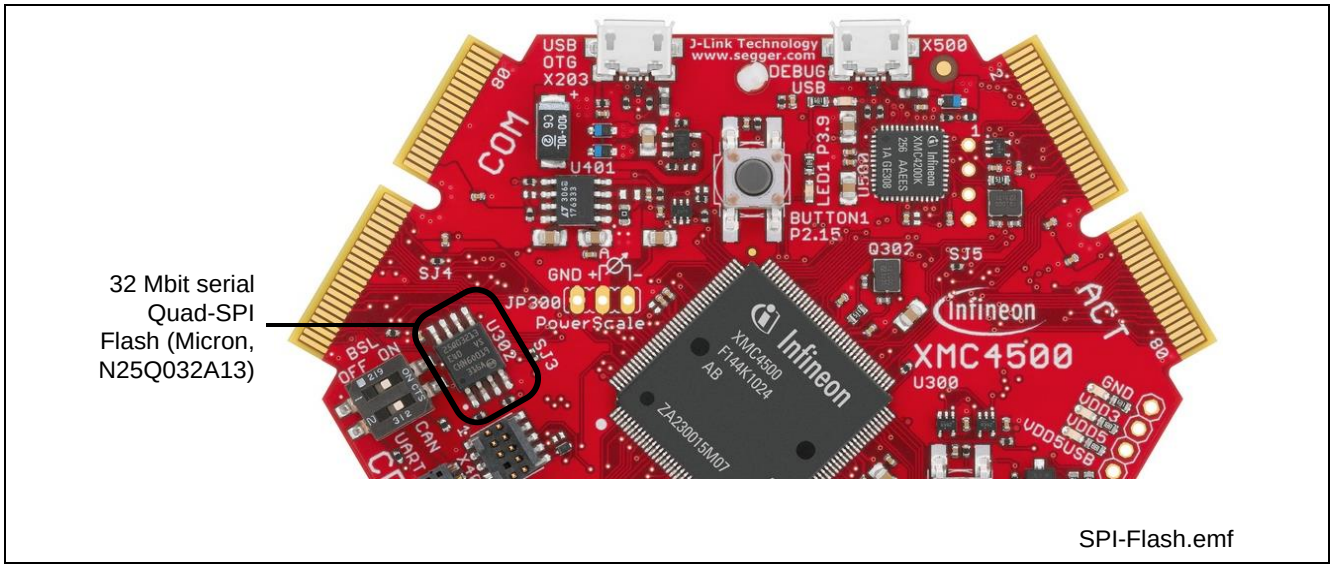

Figure 16 Quad SPI Flash

2.7 USB

The XMC4500 supports USB interface in host only mode, device only mode or as an OTG Dual Role Device (DRD). In USB device mode, power is expected through VBUS (pin 1) from an external host (e.g. PC). When the current is more than 500 mA power from an external source through satellite cards shall be used.

Note: Some PCs, notebooks or hubs have a weak USB supply which is not sufficient for proper supply. In this case use an external 5 Volt power supply or a powered USB hub.

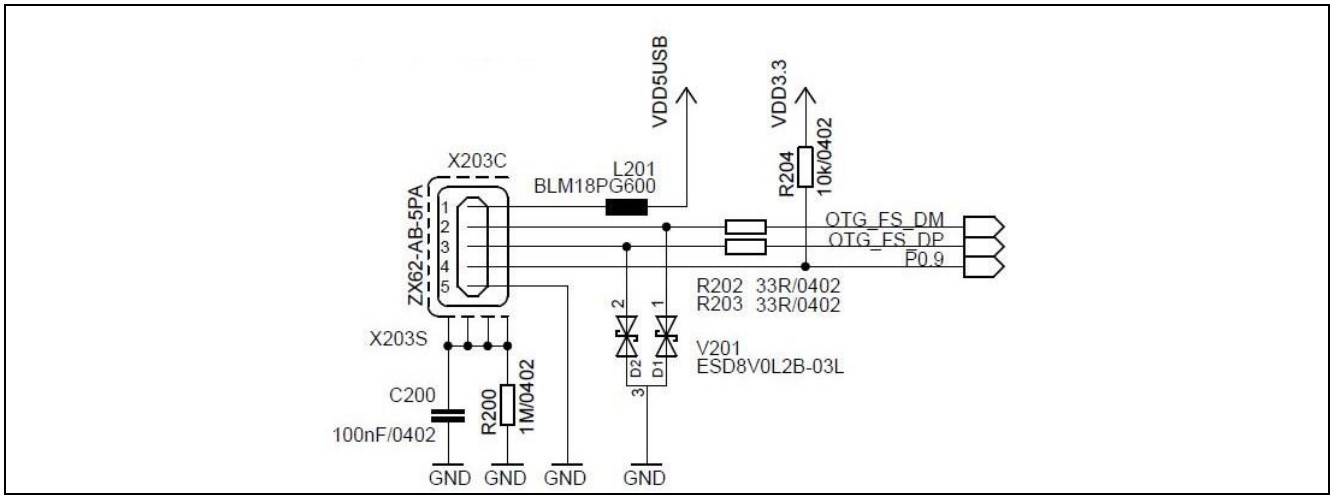

Figure 17 USB Connector Schematic

Port P0.9 of XMC4500 is connected to the USB ID pin (pin 4). An OTG device will detect whether a USB 3.0 Micro-A or Micro-B plug is inserted by checking the ID pin. When the ID = FALSE, Micro-A connector is plugged and when ID = TRUE a Micro-B connector is plugged in. When ID is true the XMC4500 acts as USB host else as USB device.

Table 7 USB micro AB connector Pinout

Pin No.	Pin Name	Pin Description
1	VBUS	5 V
2	D-	Data Minus
3	D+	Data Plus
4	ID	Identification
5	GND	Ground

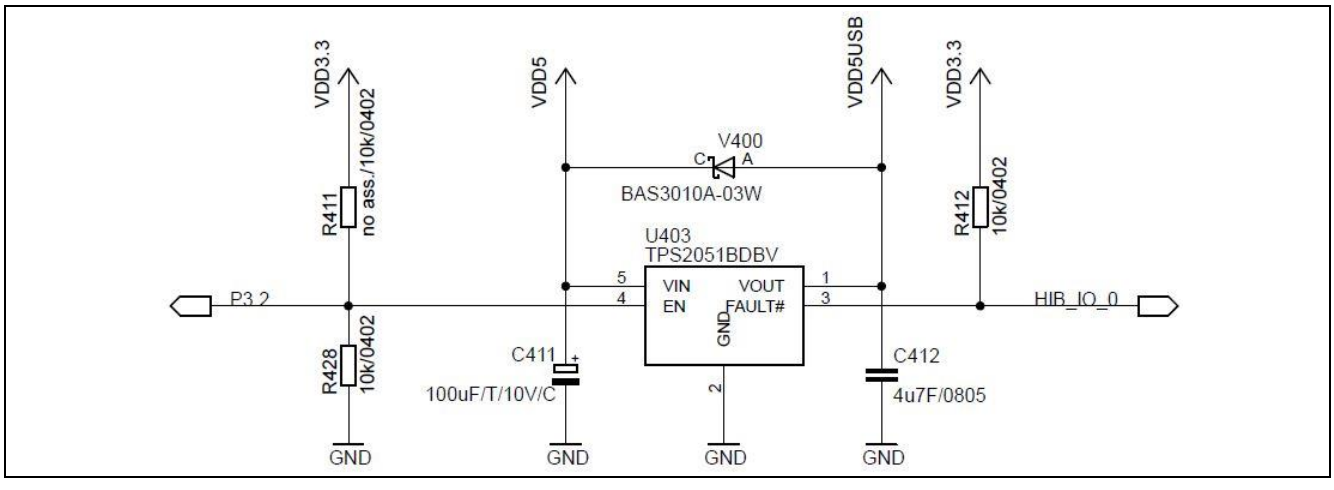

Figure 18 USB power generation - Host/OTG mode

In the host only mode and OTG mode the CPU_45A-V3 board is capable of supplying power to the connected device (e.g. USB mouse). The board has a power-switch which is controlled by the XMC4500. Port P3.2 (active high) is used for this purpose. In the Host/OTG mode a low active FAULT signal indicates to XMC4500 via HIB_IO_0 signal, if more than 500 mA current is drawn by the external device. HIB_IO_0 signal is used as general purpose input pin for this implementation.

Diode V400 will allow powering the board through USB in all USB modes via e.g. a PC.

2.8 RTC

The XMC4400 CPU has two power domains, the Core Domain and Hibernate Domain. The Core Domain (VDDP pins) is connected to the VDD3.3 rail. An on-board LDO voltage regulator generates VDD3.3 (3.3 V) from VDD5 (5 V).

The Hibernate Domain is powered via the auxiliary supply pin VBAT, which is supplied by either a 3 V coin cell (size 1216, 1220, 1225) plugged into the battery holder (see Figure 19) or 3.3 V (VDD3.3) generated by the on-board voltage regulator.

Figure 19 Battery Holder for Coin Cell

The Real Time Clock (RTC) is located in the hibernate domain. The XMC4500 uses the HIB_IO_1 signal (active low) to shut down the external LDO voltage regulator which generates the VDD3.3 (Core Domain). Even if the Core Domain is not powered the Hibernate Domain will operate if VBAT is available. The RTC keeps running as long as the Hibernate Domain is powered via the auxiliary supply VBAT. The RTC is capable to wake-up the whole system from Hibernate mode by setting HIB_IO_1 to high.

With VDD3.3 power supply switched off and no coin cell supply the power in the capacitor connected to VBAT will provide power to the hibernate domain for about 10 seconds (depending on which features in the hibernate domain are enabled).

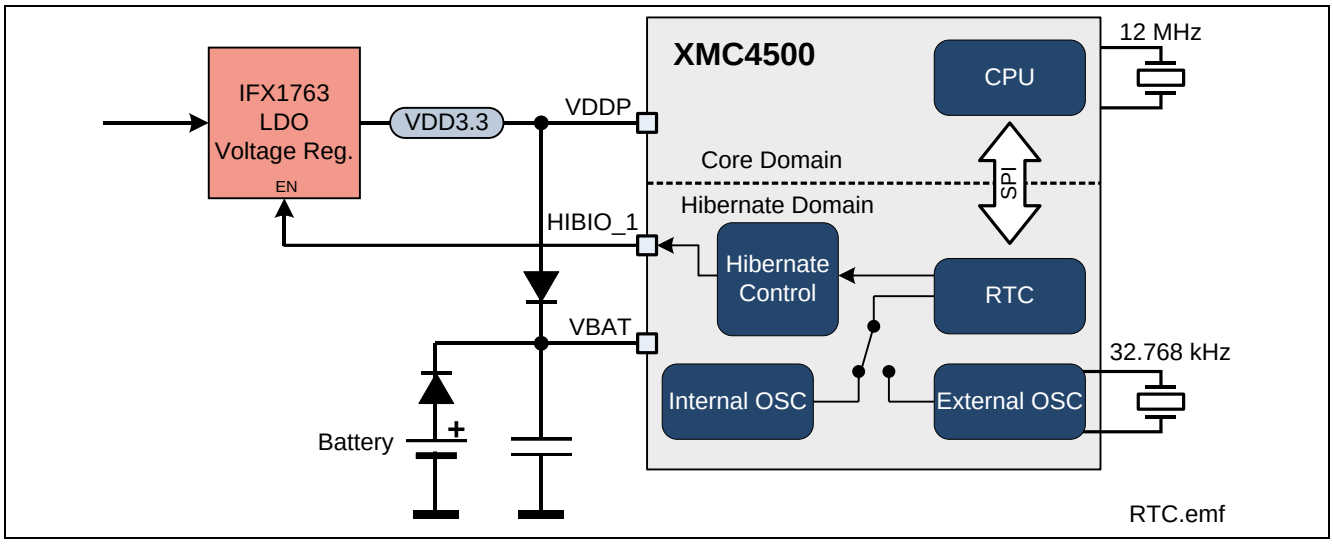

Figure 20 RTC

2.9 User LEDs and User Buttons

The port pin P3.9 of XMC4500 is connected to a LED V300. More user LED's are available through I2C GPIO expander on most of the satellite cards.

Table 8 GPIO LED

LED	Connected to Port Pin

The User Button is connected to port pin P2.15 of the XMC4500.

Table 9 User Button

Button	Connected to Port Pin
BUTTON1	P2.15

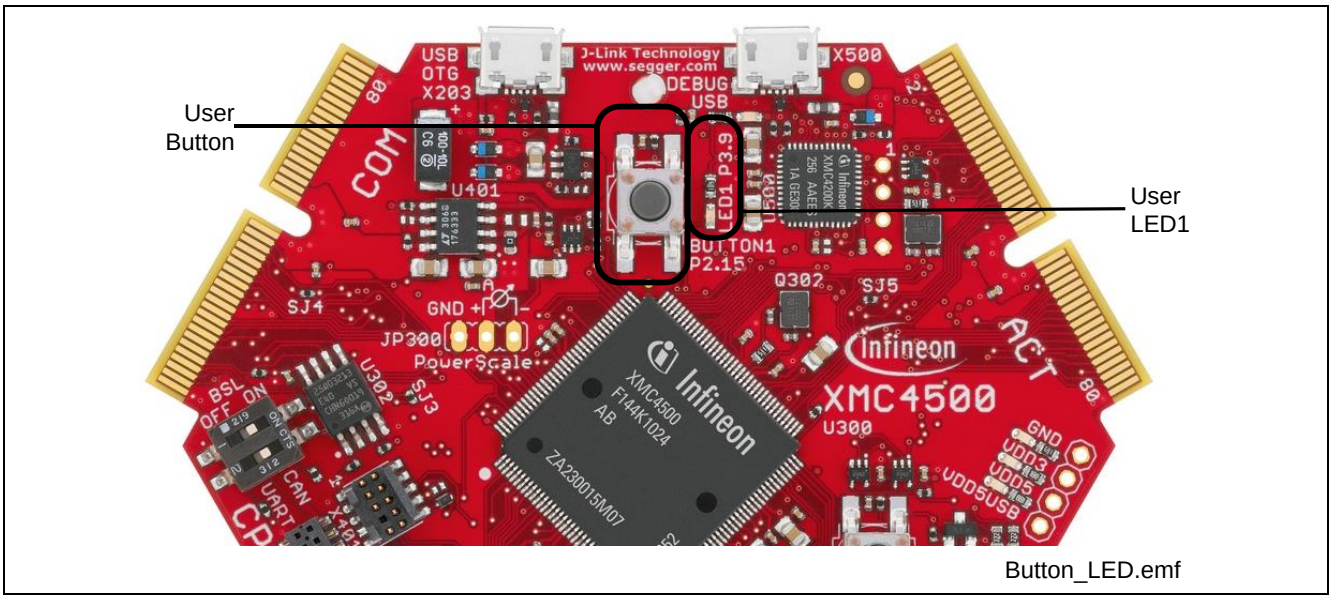

Figure 21 GPIO LED

2.10 Potentiometer

The CPU_45A-V3 board provides a potentiometer POT1 for ease of use and testing of the on-chip analog to digital converter. The potentiometer is connected to the analog input G0_CH1 (P14.1). The analog output of the potentiometer ranges from 0 V to 3.3 V.

Table 10 Potentiometer

R300	P14.1 / G0_CH1 (Group 0, Channel 1)

2.11 Satellite Connectors

The CPU_45A-V3 board provies three satellite connectors for application extension by satellite cards:

- COM satellite connector (Communication)
- HMI satellite connector (Human Machine Interface)
- ACT satellite connector (Actuator)

Note: Satellite cards shall be connected to their matching satellite connectors only. (For e.g. COM satellite cards shall be connected to COM satellite connector only)

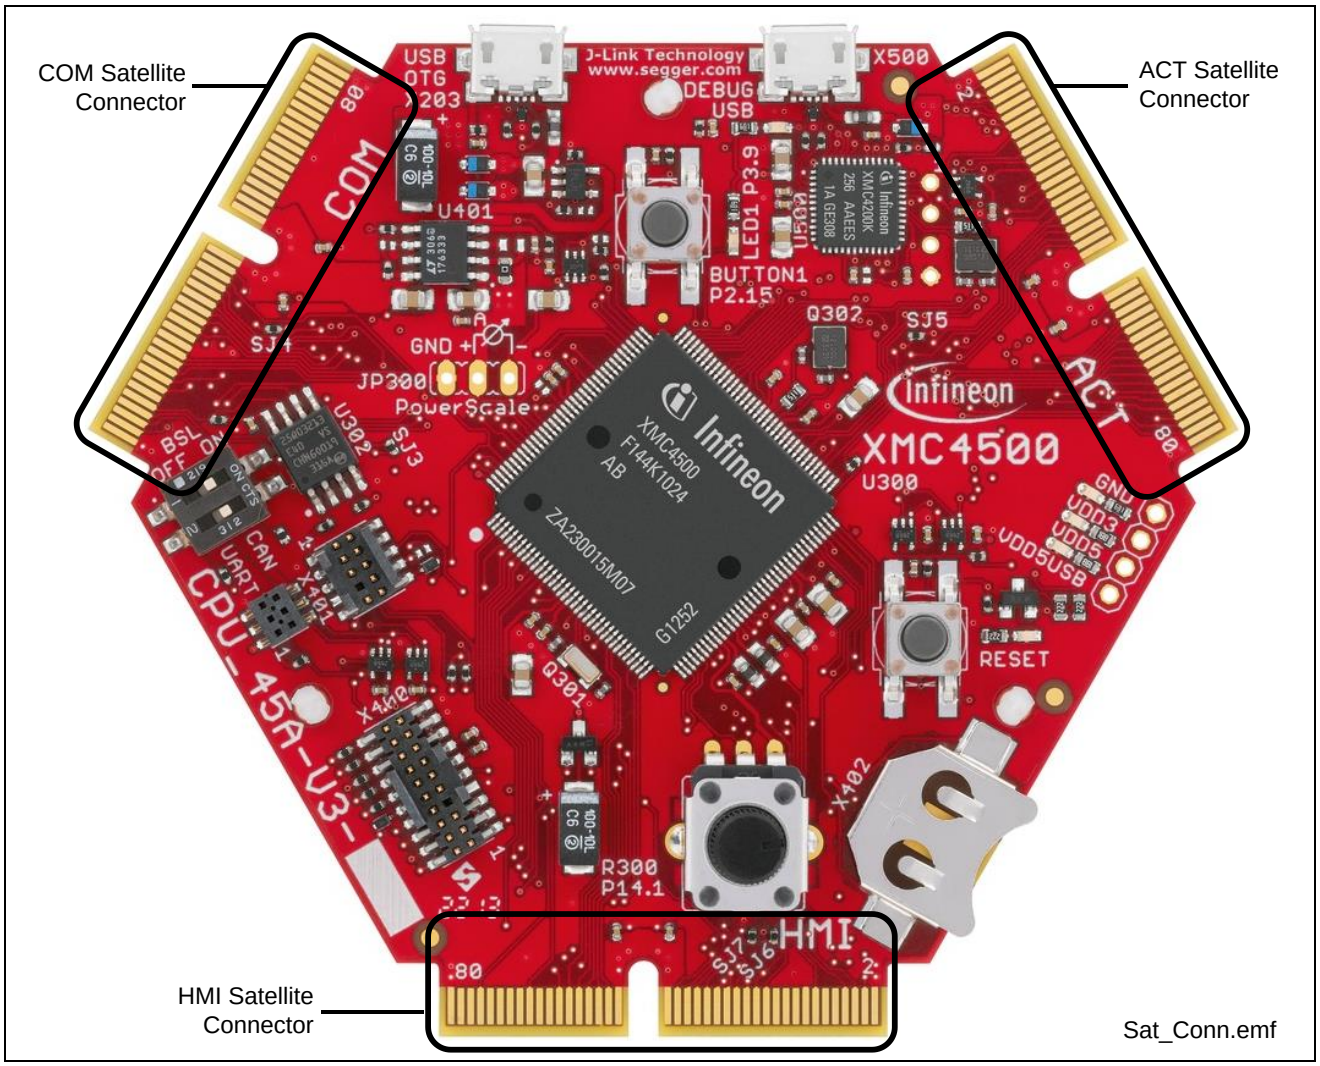

Figure 22 Satellite Connectors

(2) P0.8 is used as TRST in order to enable JTAG Debug

(3) This pin is connected with the satellite connector via an analog switch

3 Differences to Board Version V2

Table 11 Differences to older board versions

Topic of Change	Description
Debugger	An on-board debugger has been added. The debugger has an USB interface (X500). An external debugger can still be used via X400 / X401.
User Push Button	A user button as been added. The user button is connected to P2.15. In V2 versions P2.15 was connected to P2.14.
I2C Connection	The SDA signal of the I2C is connected to P2.14 only. In V2 versions the SDA signal was connected to P2.14 and P2.15.
USB Shielding	The USB shield has been connected to ground through a 1 MOhm resistor and a 100 nF capacitor

4 Production Data

4.1 Schematics

This chapter contains the schematics for the CPU board:

- Schematic of Satellite Connectors, USB-OTG
- Schematic of XMC4500
- Schematic of Power Supply, Debug Connectors, Reset Circuit
- Schematic of On-board Debugger

The board has been designed with Eagle. The PCB design data of this board can be downloaded from www.infineon.com/xmc-dev.

Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
