

# UG230: EFR32MG1P732 2.4 GHz 19.5 dBm Radio Board

The SLWRB4154A Radio Board for the Wireless Starter Kit Mainboard is an excellent starting point to get familiar with the EFR32™ Mighty Gecko Wireless System-on-Chip.

The Wireless Starter Kit Mainboard contains sensors and peripherals demonstrating some of the Mighty Gecko's many capabilities. These together provide all necessary tools for developing a Silicon Labs wireless application.

The WSTK Mainboard is included with all Silicon Labs Wireless Starter Kits. It is not included when purchasing a single radio board.

## RADIO BOARD FEATURES

- EFR32 Mighty Gecko Wireless SoC with 256 kB Flash, 32 kB RAM and 512 kB of co-packaged serial flash for over the air updates. (EFR32MG1P732F256GM32)
- Inverted-F PCB antenna (2.4 GHz band)

## WSTK MAINBOARD FEATURES

- Ethernet and USB connectivity
- Advanced Energy Monitor
- Packet Trace Interface support
- SEGGER J-Link on-board debugger
- Debug Multiplexer supporting external hardware as well as radio board
- Silicon Labs' Si7021 Relative Humidity and Temperature sensor
- Ultra low power 128x128 pixel Memory LCD
- User LEDs / Pushbuttons
- 20-pin 2.54 mm header for expansion boards
- Breakout pads for direct access to all radio I/O pins
- Power sources includes USB, CR2032 coin cell and AA batteries.

## SOFTWARE SUPPORT

- Simplicity Studio™
- Energy Profiler
- Network Analyzer

## 1. Introduction

The SLWRB4154A Radio Board is a single EFR32MG1P732 2.4 GHz 19.5 dBm radio board for the Wireless Starter Kit Mainboard.

A radio board and a mainboard used together makes a complete development platform for Silicon Labs EFR32 Mighty Gecko Wireless System-on-Chips.

The Wireless Starter Kit Mainboard features an on-board J-Link debugger, an Advanced Energy Monitor for real-time current and voltage monitoring, a virtual COM port interface, and access to the Packet Trace Interface (PTI).

All debug functionality, including AEM, VCOM and PTI, can also be used towards an external target instead of the connected radio board.

To further enhance the WSTK usability, the WSTK Mainboard contains sensors and peripherals demonstrating some of the Wireless SoC's many capabilities.

The radio board features an EFR32 and the RF interface. Please refer to the Radio Board Reference Manual for detailed specifications and RF performance figures.

### 1.1 Kit Contents

The following items are included with the SLWRB4154A:

- 1x BRD4154A EFR32MG1P732 2.4 GHz 19.5 dBm Radio Board

### 1.2 Getting Started

Detailed instructions for how to get started can be found on the Silicon Labs web pages:

<http://www.silabs.com/start-efr32mg>

## 2. Kit Hardware Overview

A view of the EFR32MG1P732 2.4 GHz 19.5 dBm Radio Board with a Wireless STK Mainboard is shown below.

Figure 2.1. SLWRB4154A with Wireless STK Mainboard

### 3. Block Diagram

A system overview of the EFR32MG1P732 2.4 GHz 19.5 dBm Radio Board used together with an Wireless STK Mainboard is shown in the figure below.

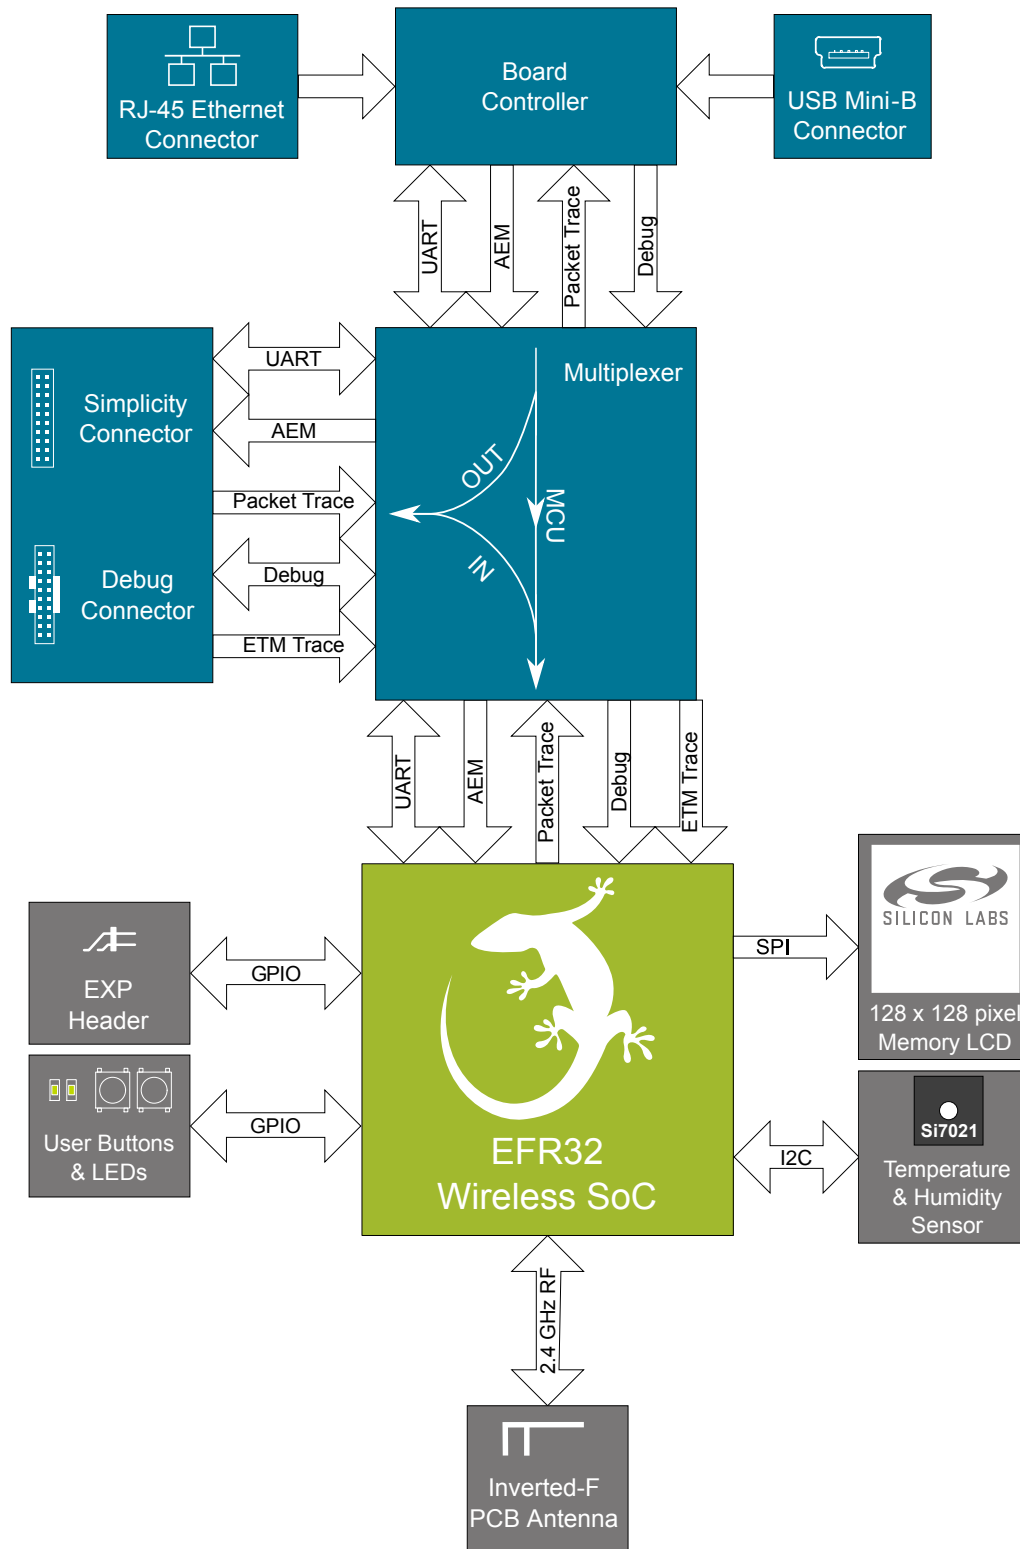

Figure 3.1. Kit Block Diagram

## 4. Connectors

This chapter gives you an overview of the Wireless Starter Kit Mainboard connectivity. The placement of the connectors can be seen in the figure below.

Figure 4.1. Mainboard Connector Layout

### 4.1 Breakout Pads

Most of the EFR32's pins are routed from the radio board to breakout pads at the top and bottom edges of the Wireless Starter Kit Mainboard. A 2.54 mm pitch pin header can be soldered on for easy access to the pins. The figure below shows you how the pins of the EFR32 maps to the pin numbers printed on the breakout pads. To see the available functions on each, please refer to the EFR32MG1P732F256GM32 Data Sheet.

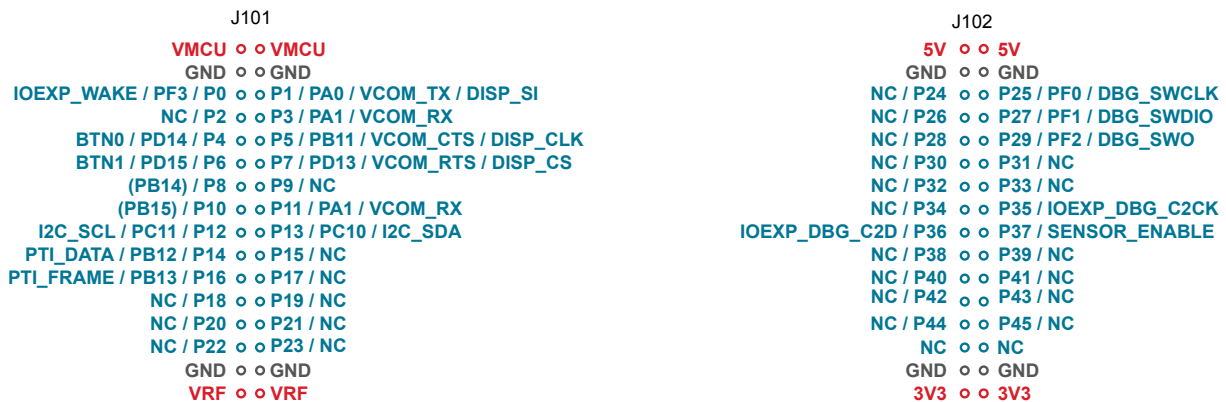

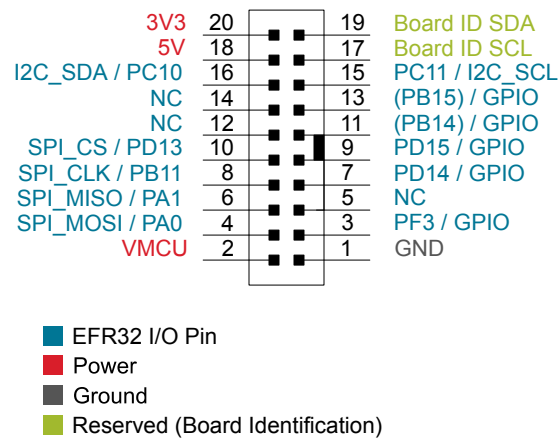

Figure 4.2. Radio Board Pin Mapping on Breakout Pads

## 4.2 Expansion Header

On the right hand side of the board an angled 20-pin expansion header is provided to allow connection of peripherals or plugin boards. The connector contains a number of I/O pins that can be used with most of the EFR32 Mighty Gecko's features. Additionally, the VMCU, 3V3 and 5V power rails are also exported.

The connector follows a standard which ensures that commonly used peripherals such as an SPI, a UART and an I2C bus are available on fixed locations in the connector. The rest of the pins are used for general purpose IO. This allows the definition of expansion boards that can plug into a number of different Silicon Labs starter kits.

The figure below shows the pin assignment of the expansion header for the EFR32MG1P732 2.4 GHz 19.5 dBm Radio Board. Because of limitations in the number of available GPIO pins, some of the expansion header pins are shared with kit features.

**Figure 4.3. Expansion Header**

### 4.2.1 Expansion Header Pin-out

The pin-routing on the EFR32 is very flexible, so most peripherals can be routed to any pin. However, many pins are shared between the Expansion Header and other functions on the Wireless STK Mainboard. [Table 4.1 Expansion Header Pinout on page 6](#) includes an overview of the mainboard features that share pins with the Expansion Header.

**Table 4.1. Expansion Header Pinout**

Pin	Connection	EXP Header function	Shared feature	Peripheral mapping
20	3V3	Board controller supply		
18	5V	Board USB voltage		
16	PC10	I2C_SDA	SENSOR_I2C_SDA, IOEXP_I2C_SDA	I2C0_SDA #15
14	Not Connected			
12	Not Connected			
10	PD13	SPI_CS	VCOM_RTS, DISP_CS	USART0_CS #18
8	PB11	SPI_CLK	VCOM_CTS, DISP_CLK	USART0_CLK #4
6	PA1	SPI_MISO	VCOM_RX	USART0_RX #0
4	PA0	SPI_MOSI	VCOM_TX, DISP_MOSI	USART0_TX #0
2	VMCU	EFR32 voltage domain, included in AEM measurements.		
19	BOARD_ID_SDA	Connected to Board Controller for identification of add-on boards.		
17	BOARD_ID_SCL	Connected to Board Controller for identification of add-on boards.		
15	PC11	I2C_SCL	SENSOR_I2C_SCL, IOEXP_I2C_SCL	I2C0_SCL #15
13	(PB15 with opt. solder bridge)	GPIO	(LFXTAL)	
11	(PB14 with opt. solder bridge)	GPIO	(LFXTAL)	
9	PD15	GPIO	BTN1	
7	PD14	GPIO	BTN0	
5	Not Connected			
3	PF3	GPIO	IOEXP_WAKE	
1	GND	Ground		

**Note:** Pin PF3 is used for DBG\_TDI in JTAG mode only. When Serial Wire Debugging is used, PF3 can be used for other purposes.

### 4.3 Debug Connector

The Debug Connector serves multiple purposes based on the "debug mode" setting which can be configured in Simplicity Studio. When mode is set to "Debug IN", this connector allows an external debug emulator to be used with the radio board EFR32. When set to "Debug OUT", this connector allows the kit to be used as a debugger towards an external target. When set to "Debug MCU" (default), this connector is isolated from the debug interface of both the Board Controller and the on-board target device.

Because this connector is automatically switched to support the different operating modes, it is only available when the Board Controller is powered (J-Link USB cable connected). If debug access to the target device is required when the Board Controller is unpowered, this should be done by connecting directly to the appropriate breakout pins.

The pinout of the connector follows that of the standard ARM Cortex Debug+ETM 19-pin connector. The pinout is described in detail below. Even though the connector has support for both JTAG and ETM Trace, it does not necessarily mean that the kit or the on-board target device supports this.

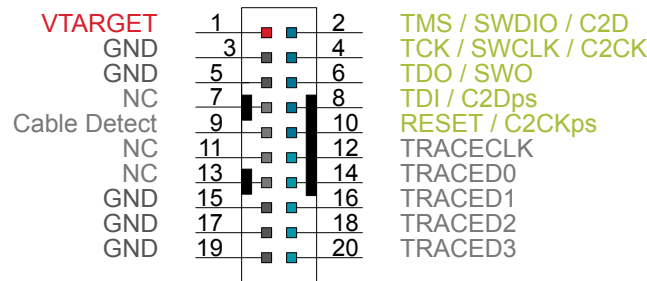

Figure 4.4. Debug Connector

**Note:** The pinout matches the pinout of an ARM Cortex Debug+ETM connector, but these are not fully compatible as pin 7 is physically removed from the Cortex Debug+ETM connector. Some cables have a small plug that prevent them from being used when this pin is present. If this is the case, remove the plug, or use a standard 2x10 1.27 mm straight cable instead.

Table 4.2. Debug Connector Pin Descriptions

Pin number(s)	Function	Description
1	VTARGET	Target voltage on the debugged application.
2	TMS / SDWIO / C2D	JTAG test mode select, Serial Wire data or C2 data
4	TCK / SWCLK / C2CK	JTAG test clock, Serial Wire clock or C2 clock
6	TDO/SWO	JTAG test data out or Serial Wire Output
8	TDI / C2Dps	JTAG test data in, or C2D "pin sharing" function
10	RESET / C2CKps	Target device reset, or C2CK "pin sharing" function
12	TRACECLK	Not connected
14	TRACED0	Not connected
16	TRACED1	Not connected
18	TRACED2	Not connected
20	TRACED3	Not connected
9	Cable detect	Connect to ground
11, 13	NC	Not connected
3, 5, 15, 17, 19	GND	Ground

#### 4.4 Simplicity Connector

The Simplicity Connector featured on the Wireless Starter Kit Mainboard enables advanced debugging features such as the AEM, the Virtual COM port and the Packet Trace Interface to be used towards an external target. The pinout is illustrated in the figure below.

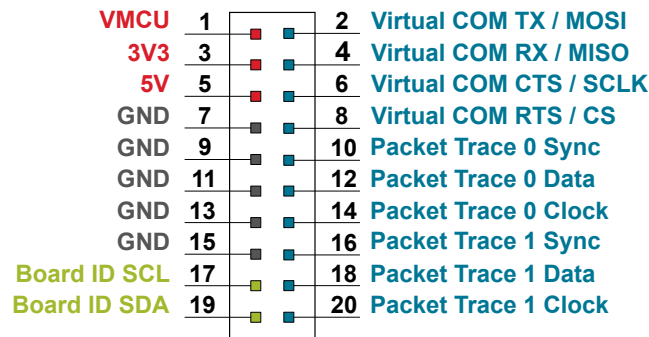

Figure 4.5. Simplicity Connector

**Note:** Current drawn from the VMCU voltage pin is included in the AEM measurements, while the 3V3 and 5V voltage pins are not. To monitor the current consumption of an external target with the AEM, unplug the WSTK Radio Board from the WSTK Mainboard to avoid that the Radio Board current consumption is added to the measurements.

Table 4.3. Simplicity Connector Pin Descriptions

Pin number(s)	Function	Description
1	VMCU	3.3 V power rail, monitored by the AEM
3	3V3	3.3 V power rail
5	5V	5 V power rail
2	VCOM_TX_MOSI	Virtual COM Tx/MOSI
4	VCOM_RX_MISO	Virtual COM Rx/MISO
6	VCOM_CTS_SCLK	Virtual COM CTS/SCLK
8	VCOM_RTS_CS	Virtual COM RTS/CS
10	PTI0_SYNC	Packet Trace 0 Sync
12	PTI0_DATA	Packet Trace 0 Data
14	PTI0_CLK	Packet Trace 0 Clock
16	PTI1_SYNC	Packet Trace 1 Sync
18	PTI1_DATA	Packet Trace 1 Data
20	PTI1_CLK	Packet Trace 1 Clock
17	EXT_ID_SCL	Board ID SCL
19	EXT_ID_SDA	Board ID SDA
7, 9, 11, 13, 15	GND	Ground

## 5. Power Supply and Reset

### 5.1 Radio Board Power Selection

The EFR32 on a Wireless Starter Kit can be powered by one of these sources:

- the debug USB cable;
- a 3V coin cell battery; or
- a USB regulator on the Radio Board (for devices with USB support only).

The power source for the radio board is selected with the slide switch in the lower left corner of the Wireless STK Mainboard. [Figure 5.1 Power Switch on page 9](#) shows how the different power sources can be selected with the slide switch.

**Figure 5.1. Power Switch**

With the switch in the **AEM** position, a low noise 3.3 V LDO on the WSTK Mainboard is used to power the Radio Board. This LDO is again powered from the debug USB cable. The Advanced Energy Monitor is now also connected in series, allowing accurate high speed current measurements and energy debugging/profiling.

With the switch in the **USB** position, radio boards with USB-support can be powered by a regulator on the radio board itself. BRD4154A does not contain an USB regulator, and setting the switch in the **USB** position will cause the EFR32 to be unpowered.

Finally, with the switch in the **BAT** position, a 20 mm coin cell battery in the CR2032 socket can be used to power the device. With the switch in this position no current measurements are active. This is the recommended switch position when powering the radio board with an external power source.

**Note:** The current sourcing capabilities of a coin cell battery might be too low to supply certain wireless applications.

**Note:** The Advanced Energy Monitor can only measure the current consumption of the EFR32 when the power selection switch is in the **AEM** position.

## 5.2 Board Controller Power

The board controller is responsible for important features such as the debugger and the Advanced Energy Monitor, and is powered exclusively through the USB port in the top left corner of the board. This part of the kit resides on a separate power domain, so a different power source can be selected for the target device while retaining debugging functionality. This power domain is also isolated to prevent current leakage from the target power domain when power to the Board Controller is removed.

The board controller power domain is exclusively supplied by the J-Link USB cable, and is not influenced by the position of the power switch.

The kit has been carefully designed to keep the board controller and the target power domains isolated from each other as one of them powers down. This ensures that the target EFR32 device will continue to operate in the **USB** and **BAT** modes.

## 5.3 EFR32 Reset

The EFR32 Wireless SoC can be reset by a few different sources:

- A user pressing the RESET button.
- The on-board debugger pulling the #RESET pin low.
- An external debugger pulling the #RESET pin low.

In addition to the reset sources mentioned above, the Board Controller will also issue a reset to the EFR32 when booting up. This means that removing power to the Board Controller (plugging out the J-Link USB cable) will not generate a reset, but plugging the cable back in will, as the Board Controller boots up.

## 6. Peripherals

The starter kit has a set of peripherals that showcase some of the features of the EFR32.

Be aware that most EFR32 I/O routed to peripherals are also routed to the breakout pads. This must be taken into consideration when using the breakout pads for your application.

### 6.1 Push Buttons and LEDs

The kit has two user push buttons marked PB0 and PB1. They are connected directly to the EFR32, and are debounced by RC filters with a time constant of 1 ms. The buttons are connected to pins PF6 and PF7.

The kit also features two yellow LEDs marked LED0 and LED1, that are controlled by GPIO pins on the EFR32. The LEDs are connected to pins PF4 and PF5 in an active-high configuration.

Figure 6.1. Buttons and LEDs

## 6.2 Memory LCD-TFT Display

A 1.28-inch SHARP Memory LCD-TFT is available on the kit to enable interactive applications to be developed. The display has a high resolution of 128 by 128 pixels, and consumes very little power. It is a reflective monochrome display, so each pixel can only be light or dark, and no backlight is needed in normal daylight conditions. Data sent to the display is stored in the pixels on the glass, which means no continuous refreshing is required to maintain a static image.

The display interface consists of an SPI-compatible serial interface and some extra control signals. Pixels are not individually addressable, instead data is sent to the display one line (128 bits) at a time.

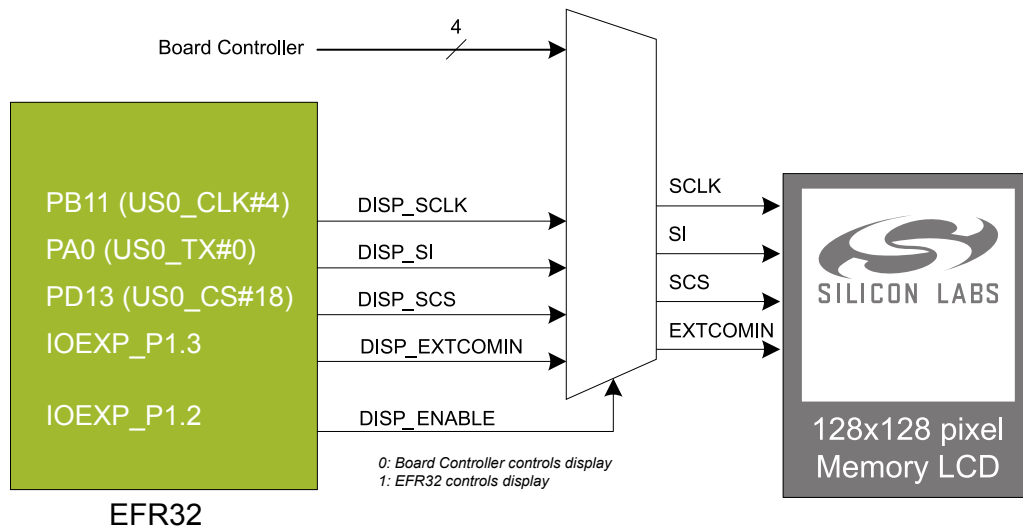

The Memory LCD-TFT display is shared with the kit Board Controller, allowing the Board Controller application to display useful information when the user application is not using the display. The user application always controls ownership of the display with the DISP\_ENABLE signal:

- DISP\_ENABLE = LOW: The Board Controller has control of the display
- DISP\_ENABLE = HIGH: The user application (EFR32) has control of the display

Power to the display is sourced from the target application power domain when the EFR32 controls the display, and from the Board Controller's power domain when the DISP\_ENABLE line is low. Data is clocked in on DISP\_SI when DISP\_CS is high, and the clock is sent on DISP\_SCLK. The maximum supported clock speed is 1.1 MHz.

DISP\_COM is the "COM Inversion" line. It must be pulsed periodically to prevent static build-up in the display itself. Please refer to the display application information for details on driving the display:

<http://www.sharpmemorylcd.com/1-28-inch-memory-lcd.html>

**Figure 6.2. 128x128 Pixel Memory LCD**

### 6.3 Si7021 Relative Humidity and Temperature Sensor

The Si7021 I<sup>2</sup>C relative humidity and temperature sensor is a monolithic CMOS IC integrating humidity and temperature sensor elements, an analog-to-digital converter, signal processing, calibration data, and an I<sup>2</sup>C Interface. The patented use of industry-standard, low-K polymeric dielectrics for sensing humidity enables the construction of low-power, monolithic CMOS Sensor ICs with low drift and hysteresis, and excellent long term stability.

The humidity and temperature sensors are factory-calibrated and the calibration data is stored in the on-chip non-volatile memory. This ensures that the sensors are fully interchangeable, with no recalibration or software changes required.

The Si7021 is available in a 3x3 mm DFN package and is reflow solderable. It can be used as a hardware- and software-compatible drop-in upgrade for existing RH/ temperature sensors in 3x3 mm DFN-6 packages, featuring precision sensing over a wider range and lower power consumption. The optional factory-installed cover offers a low profile, convenient means of protecting the sensor during assembly (e.g., reflow soldering) and throughout the life of the product, excluding liquids (hydrophobic/oleophobic) and particulates.

The Si7021 offers an accurate, low-power, factory-calibrated digital solution ideal for measuring humidity, dew-point, and temperature, in applications ranging from HVAC/R and asset tracking to industrial and consumer platforms.

The I<sup>2</sup>C bus used for the Si7021 is shared with the Expansion Header. The temperature sensor is normally isolated from the I<sup>2</sup>C line. To use the sensor, PD15 must be set high. When enabled, the sensor's current consumption is included in the AEM measurements.

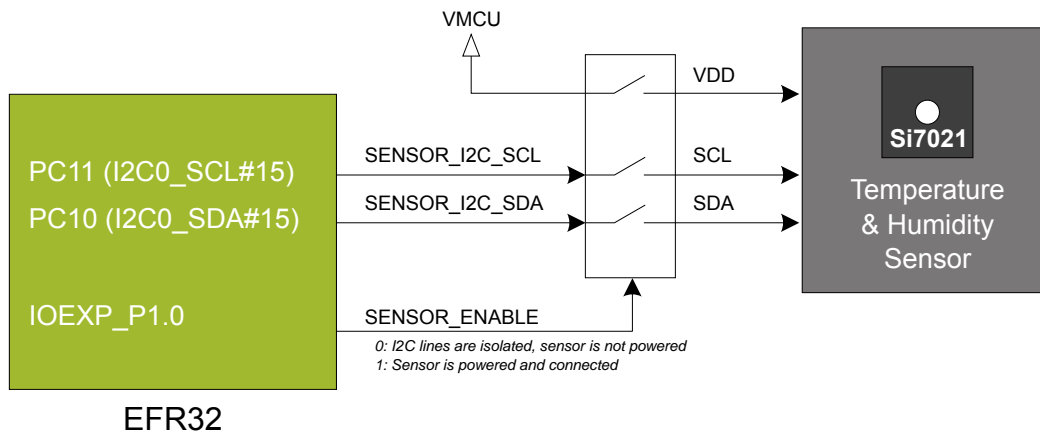

Figure 6.3. Si7021 Relative Humidity and Temperature Sensor

## 6.4 Virtual COM Port

An asynchronous serial connection to the [board controller](#) is provided for application data transfer between a host PC and the target EFR32. This eliminates the need for an external serial port adapter.

**Figure 6.4. Virtual COM Port Interface**

The Virtual COM port consists of a physical UART between the target device and the board controller, and a logical function in the board controller that makes the serial port available to the host PC over USB or Ethernet. The UART interface consists of four pins and an enable signal.

**Table 6.1. Virtual COM Port Interface Pins**

Signal	Description
VCOM_TX	Transmit data from the EFR32 to the board controller
VCOM_RX	Receive data from the board controller to the EFR32
VCOM_CTS	Clear to Send hardware flow control input, asserted by the board controller when it is ready to receive more data
VCOM_RTS	Request to Send hardware flow control output, asserted by the EFR32 when it is ready to receive more data
VCOM_ENABLE	Enables the VCOM interface, allowing data to pass through to the board controller.

The parameters of the serial port, such as baud rate or flow control, can be configured using the [admin console](#). The default settings depends on which radio board is used with the Wireless Starter Kit Mainboard. Please see [10. Device Connectivity](#) for more details.

**Note:** The VCOM port is only available when the board controller is powered, which requires the J-Link USB cable to be inserted.

## 7. Board Controller

The Wireless Starter Kit Mainboard contains a microcontroller separate from the EFR32 Mighty Gecko that is responsible for some of the advanced kit features provided. This microcontroller is referred to as the "Board Controller", and is not programmable by the user. The board controller acts as an interface between the host PC and the target device on the radio board, as well as handling some house-keeping functions on the board.

Some of the kit features actively managed by the board controller are:

- The , which can flash and debug both on-board and external targets.
- The [Advanced Energy Monitor](#), which provides real-time energy profiling of the user application.
- The Packet Trace Interface , which is used in conjunction with PC software to provide detailed insight into an active radio network.
- The [Virtual COM Port](#) and [Virtual UART](#) interfaces, which provide ways to transfer application data between the host PC and the target processor.
- The [Admin Console](#), which provides configuration of the various board features.

Silicon Labs publishes updates to the board controller firmware in form of firmware upgrade packages. These updates may enable new features or fix issues. See [11.2 Firmware Upgrades](#) for details on firmware upgrade.

### 7.1 Admin Console

The admin console is a command line interface to the board controller on the kit. It provides functionality for configuring the kit behavior and retrieving configuration and operational parameters.

#### ■ Connecting

The SLWRB4154A must be connected to Ethernet using the Ethernet connector in the top left corner of the mainboard for the admin console to be available. See • [Ethernet Interface](#) for details on the Ethernet connectivity.

Connect to the Admin Console by opening a telnet connection to the kit's IP address, port number 4902.

When successfully connected, a `WSTK>` prompt is displayed.

## ■ Built-in Help

The admin console has a built in help system which is accessed by the `help` command. The `help` command will print a list of all top level commands:

```
WSTK> help
***** Root commands *****
aem          AEM commands  [ calibrate, current, dump, ... ]
boardid      Commands for board ID probe.  [ list, probe ]
dbg          Debug interface status and control  [ info, mode,]
dch          Datachannel control and info commands  [ info ]
discovery    Discovery service commands.
net          Network commands.  [ dnslookup, geoprobe, ip ]
pti          Packet trace interface status and control  [ config, disable, dump, ... ]
quit         Exit from shell
sys          System commands  [ nickname, reset, scratch, ... ]
target       Target commands.  [ button, flashwrite, go, ... ]
time         Time Service commands  [ client, server ]
user         User management functions  [ login,]
```

The `help` command can be used in conjunction with any top level command to get a list of sub-commands with description. For example, `pti help` will print a list of all available sub-commands of `pti`:

```
WSTK> pti help
***** pti commands *****
config       Configure packet trace
disable      Disable packet trace
dump         Dump PTI packets to the console as they come
enable       Enable packet trace
info         Packet trace state information
```

This means that running `pti enable` will enable packet trace.

## ■ Command Examples

### PTI Configuration

```
pti config 0 efruart 1600000
```

Configures PTI to use the "EFRUART" mode at 1.6 Mb/s.

### Serial Port Configuration

```
serial config vcom handshake enable
```

Enables hardware handshake on the VCOM UART connection.

## 8. Advanced Energy Monitor

### 8.1 Introduction

Any embedded developer seeking to make his embedded code spend as little energy as the underlying architecture supports, needs tools to easily and quickly discover inefficiencies in the running application.

This is what the Simplicity Energy Profiler is designed to do. It will in real-time graph and log current as a function of time while correlating this to the actual target application code running on the EFR32. There are multiple features in the profiler software that allows for easy analysis, such as markers and statistics on selected regions of the current graph or aggregate energy usage by different parts of the application.

### 8.2 Theory of Operation

The Advanced Energy Monitor (AEM) circuitry on the board is capable of measuring current signals in the range of 0.1  $\mu\text{A}$  to 95 mA, which is a dynamic range of almost 120 dB. It can do this while maintaining approximately 10 kHz of current signal bandwidth. This is accomplished through a combination of a highly capable current sense amplifier, multiple gain stages and signal processing within the kit's board controller before the current sense signal is read by a host computer for display and/or storage.

The current sense amplifier measures the voltage drop over a small series resistor, and the gain stage further amplifies this voltage with two different gain settings to obtain two current ranges. The transition between these two ranges occurs around 250  $\mu\text{A}$ .

The current signal is combined with the target processor's Program Counter (PC) sampling by utilizing a feature of the ARM CoreSight debug architecture. The ITM (Instrumentation Trace Macrocell) block can be programmed to sample the MCU's PC at periodic intervals (50 kHz) and output these over SWO pin ARM devices. When these two data streams are fused and correlated with the running application's memory map, an accurate statistical profile can be built, that shows the energy profile of the running application in real-time.

At kit power-up or on a power-cycle, and automatic AEM calibration is performed. This calibration compensates for any offset errors in the current sense amplifiers.

Figure 8.1. Advanced Energy Monitor

### 8.3 AEM Accuracy and Performance

The AEM is capable of measuring currents in the range of 0.1  $\mu\text{A}$  to 95 mA. For currents above 250  $\mu\text{A}$ , the AEM is accurate within 0.1 mA. When measuring currents below 250  $\mu\text{A}$ , the accuracy increases to 1  $\mu\text{A}$ . Even though the absolute accuracy is 1  $\mu\text{A}$  in the sub 250  $\mu\text{A}$  range, the AEM is able to detect changes in the current consumption as small as 100 nA.

The AEM current sampling rate is 10 kHz.

**Note:** The AEM circuitry only works when the kit is powered and the power switch is in the AEM position.

### 8.4 Usage

The AEM data is collected by the board controller and can be displayed by the Energy Profiler, available through Simplicity Studio. By using the Energy Profiler, current consumption and voltage can be measured and linked to the actual code running on the EFR32 in realtime.

## 9. On-Board Debugger

The WSTK Mainboard contains an integrated debugger, which can be used to download code and debug the EFR32. In addition to programming the EFR32 on the connected radio board, the debugger can also be used to program and debug external Silicon Labs EFM32, EFM8, EZR32 and EFR32 devices.

The debugger supports three different debug interfaces used with Silicon Labs devices:

- Serial Wire Debug, is used with all EFM32, EFR32 and EZR32 devices
- JTAG, which can be used with some newer EFR32 and EFM32 devices
- C2 Debug, which is used with EFM8 devices

In order for debugging to work properly, make sure you have the appropriate debug interface selected that works with your device. The debug connector on the board supports all three of these modes.

### 9.1 Host Interfaces

The SLWRB4154A supports connecting to the on-board debugger using either Ethernet or USB.

Many tools support connecting to a debugger using either USB or Ethernet. When connected over USB, the kit is identified by its J-Link serial number. When connected over Ethernet, the kit is normally identified by its IP address. Some tools also support using the serial number when connecting over Ethernet, this typically require the computer and the kit to be on the same subnet for the discovery protocol (using UDP broadcast packets) to work.

#### USB Interface

The USB interface is available whenever the mini-B USB connector on the left hand side of the kit is connected to a computer.

#### Ethernet Interface

The Ethernet interface is available when the kit's Ethernet connector in the top left corner is connected to a network. Normally, the kit will receive an IP address from a local DHCP server, and the IP address is printed on the LCD display. If your network does not have a DHCP server, you need to connect to the kit via USB and set the IP address manually using Simplicity Studio, Simplicity Commander or J-Link Configurator.

For the Ethernet connectivity to work, the kit must still be powered through the mini-B USB connector. See [5.2 Board Controller Power](#) for details.

#### Serial Number Identification

All Silicon Labs kits have a unique J-Link serial number which can identifies the kit to PC applications. This number is 9 digits, and is normally on the form 44xxxxxxxx.

The J-Link serial number is normally printed at the bottom of the kit LCD display.

## 9.2 Debug Modes

Programming external devices is done by connecting to a target board through the provided Debug IN/OUT Connector, and by setting the debug mode to **[Out]**. The same connector can also be used to connect an external debugger to the EFR32 Wireless SoC on the kit, by setting the debug mode to **[In]**. A summary of the different supported debug modes is given in [9.2 Debug Modes](#).

Selecting the active debug mode is done with a drop-down menu in the Kit Manager tool in Simplicity Studio.

**Debug MCU:** In this mode the on-board debugger is connected to the EFR32 on the SLWRB4154A.

Figure 9.1. Debug MCU

**Debug OUT:** In this mode, the on-board debugger can be used to debug a supported Silicon Labs device mounted on a custom board.

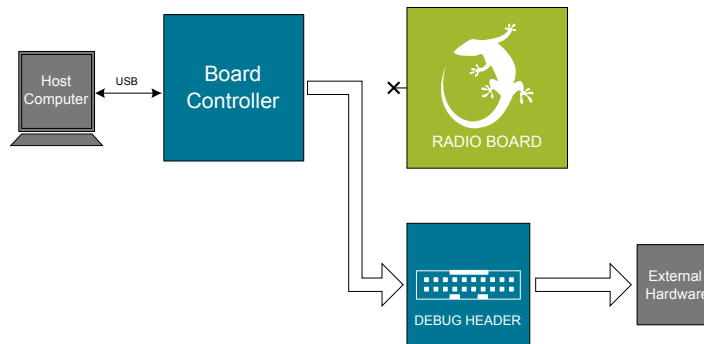

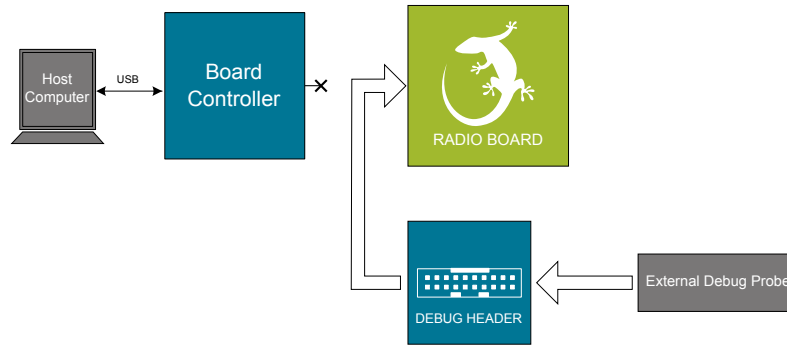

Figure 9.2. Debug OUT

**Debug IN:** In this mode, the on-board debugger is disconnected, and an external debugger can be connected to debug the EFR32 on the SLWRB4154A.

**Figure 9.3. Debug IN**

**Note:** For "Debug IN" to work, the board controller on the kit must be powered through the USB connector.

### 9.3 Debugging During Battery Operation

When the EFR32 is powered by battery and the J-Link USB is still connected, the on-board debug functionality is available. If the USB power is disconnected, the Debug In mode will stop working.

If debug access is required when the target is running of another energy source, such as a battery, and the board controller is powered down, the user should make direct connections to the GPIO used for debugging. This can be done by connecting to the appropriate pins of the breakout pads. Some Silicon Labs kits provide a dedicated pin header for this purpose.

## 10. Device Connectivity

The SLWRB4154A provides several convenient ways to communicate with a target application without soldering or using external hardware.

### 10.1 Virtual COM Port

When the target device drives the VCOM\_ENABLE (PA5) signal high, a communication line to the Board Controller is enabled. The target can then communicate to the host computer via the Board Controller using USART0, Location 0 (TX pin PA0, RX pin PA1).

When enabling VCOM, the Board Controller makes communication to the host computer possible on the following interfaces:

- Virtual USB serial port using a CDC driver.
- TCP/IP, by connecting to the Wireless STK on port 4901 with a Telnet client.

**Note:** Only one of these can be used at the same time, meaning that if a socket is connected to port 4901, no data can be sent or received on the USB COM port.

### 10.2 Virtual UART

The Virtual UART port outputs data that the target application outputs over SWO, ITM channel 0.

## 11. Kit Manager and Upgrades

The Kit Manager is a program that comes with Simplicity Studio. It can perform various kit and EFR32 specific tasks.

### 11.1 Kit Manager Operation

This utility gives the ability to program the EFR32, upgrade the kit, lock and unlock devices and more. Some of the features will only work with Silicon Labs kits, while other will work with a generic J-Link debugger connected.

The screenshot shows the Kit Manager application window with the following sections:

- Adapter Information**

Type	USB
Serial Number	440019219
Vendor	Segger
- Kit Information**

Name	EFM32 Giant Gecko Starter Kit
Board ID	BRD2200A Rev. A03
Serial Number	140502223
Firmware Version	0v9p13b391

Update Kit

Installation Package

Debug Mode:

Addressing Mode:
- MCU Information**

Name	EFM32GG990F1024
Architecture	ARM
Locked	false
Revision	1D
Production ID	20
Flash Size	1024 kB
SRAM Size	128 kB
Unique ID	0x248ab60151c79626

At the bottom left is a help icon (?) and at the bottom right is a  button.

Figure 11.1. Kit Manager

### 11.2 Firmware Upgrades

Upgrading the kit firmware is done through Simplicity Studio. Simplicity Studio will automatically check for new updates on startup.

You can also use the Kit Manager for manual upgrades. Click the **[Browse]** button in the **[Update Kit]** section to select the correct file ending in ".emz". Then, click the **[Install Package]** button.

## 12. Schematics, Assembly Drawings and BOM

The schematics, assembly drawings and bill of materials (BOM) for the hardware included in the EFR32MG1P732 2.4 GHz 19.5 dBm Radio Board are available through Simplicity Studio when the kit documentation package has been installed.

## 13. Kit Revision History and Errata

### 13.1 Revision History

The kit revision can be found printed on the box label of the kit, as outlined in the figure below.

Figure 13.1. Revision info

Table 13.1. Kit Revision History

Kit Revision	Released	Description
A01	2016-04-20	Initial release.

### 13.2 Errata

There are no known errata at present.

## 14. Document Revision History

### Revision 1.00

2016-04-20

Initial document release.

**Стандарт  
Электрон  
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
