

---

**Low-power, precision, rail-to-rail, 9.0 MHz, 16 V operational amplifier**

---

Datasheet - production data

SOT23-5

**Description**

The TSX7191, TSX7191A single, operational amplifier (op amp) offers high precision functioning with low input offset voltage down to a maximum of 200  $\mu\text{V}$  at 25  $^{\circ}\text{C}$ . In addition, its rail-to-rail input and output functionality allows this product to be used on full range input and output without limitation. This is particularly useful for a low-voltage supply such as 2.7 V that the TSX7191, TSX7191A is able to operate with.

Thus, the TSX7191, TSX7191A has the great advantage of offering a large span of supply voltages, ranging from 2.7 V to 16 V. It can be used in multiple applications with a unique reference.

Low input bias current performance makes the TSX7191, TSX7191A perfect when used for signal conditioning in sensor interface applications. In addition, low-side and high-side current measurements can be easily made thanks to rail-to-rail functionality. The TSX7191, TSX7191A is a decompensated amplifier and must be used with a gain greater than 10 to ensure stability.

High ESD tolerance (4 kV HBM) and a wide temperature range are also good arguments to use the TSX7191, TSX7191A in the automotive market segment.

**Features**

- Low input offset voltage: 200  $\mu\text{V}$  max.
- Rail-to-rail input and output
- Low current consumption: 850  $\mu\text{A}$  max.
- Gain bandwidth product: 9 MHz
- Low supply voltage: 2.7 - 16 V
- Stable when used with Gain  $\geq 10$
- Low input bias current: 50 pA max.
- High ESD tolerance: 4 kV HBM
- Extended temp. range: -40  $^{\circ}\text{C}$  to +125  $^{\circ}\text{C}$
- Automotive qualification

**Related products**

- See the TSX711 for lower speeds with similar precision
- See the TSX561 for low-power features
- See the TSX631 for micro-power features
- See the TSX921 for higher speeds

**Applications**

- Battery-powered instrumentation
- Instrumentation amplifier
- Active filtering
- High-impedance sensor interface
- Current sensing (high and low side)

## 2 Absolute maximum ratings and operating conditions

Table 1: Absolute maximum ratings (AMR)

Symbol	Parameter	Value	Unit
V <sub>CC</sub>	Supply voltage <sup>(1)</sup>	18	V
V <sub>id</sub>	Differential input voltage <sup>(2)</sup>	±V <sub>CC</sub>	mV
V <sub>in</sub>	Input voltage	V <sub>CC</sub> - 0.2 to V <sub>CC</sub> + 0.2	V
I <sub>in</sub>	Input current <sup>(3)</sup>	10	mA
T <sub>stg</sub>	Storage temperature	-65 to +150	°C
R <sub>thja</sub>	Thermal resistance junction to ambient <sup>(4) (5)</sup>	250	°C/W
T <sub>j</sub>	Maximum junction temperature	150	°C
ESD	HBM: human body model <sup>(6)</sup>	4000	V
	MM: machine model <sup>(7)</sup>	100	
	CDM: charged device model <sup>(8)</sup>	1500	
	Latch-up immunity	200	mA

**Notes:**

<sup>(1)</sup>All voltage values, except the differential voltage are with respect to the network ground terminal.

<sup>(2)</sup>Differential voltages are the non-inverting input terminal with respect to the inverting input terminal. See [Section 4.7](#) for the precautions to follow when using the TSX711 with a high differential input voltage.

<sup>(3)</sup>Input current must be limited by a resistor in series with the inputs.

<sup>(4)</sup>R<sub>th</sub> are typical values.

<sup>(5)</sup>Short-circuits can cause excessive heating and destructive dissipation.

<sup>(6)</sup>According to JEDEC standard JESD22-A114F.

<sup>(7)</sup>According to JEDEC standard JESD22-A115A.

<sup>(8)</sup>According to ANSI/ESD STM5.3.1

## 4 Application information

### 4.1 Operating voltages

The TSX7191, TSX7191A device can operate from 2.7 to 16 V. The parameters are fully specified for 4 V, 10 V, and 16 V power supplies. However, the parameters are very stable in the full  $V_{CC}$  range. Additionally, the main specifications are guaranteed in extended temperature ranges from -40 to +125 °C.

### 4.2 Input pin voltage ranges

The TSX7191, TSX7191A device has internal ESD diode protection on the inputs. These diodes are connected between the input and each supply rail to protect the input MOSFETs from electrical discharge.

If the input pin voltage exceeds the power supply by 0.5 V, the ESD diodes become conductive and excessive current can flow through them. Without limitation this over current can damage the device.

In this case, it is important to limit the current to 10 mA, by adding resistance on the input pin, as described in [Figure 30](#).

Figure 30: Input current limitation

### 4.3 Rail-to-rail input

The TSX7191, TSX7191A device has a rail-to-rail input, and the input common mode range is extended from  $V_{CC} - 0.1$  V to  $V_{CC} + 0.1$  V.

### 4.4 Rail-to-rail output

The operational amplifier output levels can go close to the rails: to a maximum of 30 mV above and below the rail when connected to a 10 k $\Omega$  resistive load to  $V_{CC}/2$ .

## 4.5 Input offset voltage drift over temperature

The maximum input voltage drift variation over temperature is defined as the offset variation related to the offset value measured at 25 °C. The operational amplifier is one of the main circuits of the signal conditioning chain, and the amplifier input offset is a major contributor to the chain accuracy. The signal chain accuracy at 25 °C can be compensated during production at application level. The maximum input voltage drift over temperature enables the system designer to anticipate the effect of temperature variations.

The maximum input voltage drift over temperature is computed using [Equation 1](#).

### Equation 1

$$\frac{\Delta V_{io}}{\Delta T} = \max \left| \frac{V_{io}(T) - V_{io}(25\text{ °C})}{T - 25\text{ °C}} \right|$$

Where T = -40 °C and 125 °C.

The TSX7191, TSX7191A datasheet maximum value is guaranteed by measurements on a representative sample size ensuring a C<sub>pk</sub> (process capability index) greater than 1.3.

## 4.6 Long term input offset voltage drift

To evaluate product reliability, two types of stress acceleration are used:

- Voltage acceleration, by changing the applied voltage
- Temperature acceleration, by changing the die temperature (below the maximum junction temperature allowed by the technology) with the ambient temperature.

The voltage acceleration has been defined based on JEDEC results, and is defined using [Equation 2](#).

### Equation 2

$$A_{FV} = e^{\beta \cdot (V_S - V_U)}$$

Where:

A<sub>FV</sub> is the voltage acceleration factor

β is the voltage acceleration constant in 1/V, constant technology parameter (β = 1)

V<sub>S</sub> is the stress voltage used for the accelerated test

V<sub>U</sub> is the voltage used for the application

The temperature acceleration is driven by the Arrhenius model, and is defined in [Equation 3](#).

### Equation 3

$$A_{FT} = e^{\frac{E_a}{k} \cdot \left( \frac{1}{T_U} - \frac{1}{T_S} \right)}$$

Where:

A<sub>FT</sub> is the temperature acceleration factor

E<sub>a</sub> is the activation energy of the technology based on the failure rate

$k$  is the Boltzmann constant ( $8.6173 \times 10^{-5} \text{ eV.K}^{-1}$ )

$T_U$  is the temperature of the die when  $V_U$  is used (K)

$T_S$  is the temperature of the die under temperature stress (K)

The final acceleration factor,  $A_F$ , is the multiplication of the voltage acceleration factor and the temperature acceleration factor ([Equation 4](#)).

#### Equation 4

$$A_F = A_{FT} \times A_{FV}$$

$A_F$  is calculated using the temperature and voltage defined in the mission profile of the product. The  $A_F$  value can then be used in [Equation 5](#) to calculate the number of months of use equivalent to 1000 hours of reliable stress duration.

#### Equation 5

$$\text{Months} = A_F \times 1000 \text{ h} \times 12 \text{ months} / (24 \text{ h} \times 365.25 \text{ days})$$

To evaluate the op amp reliability, a follower stress condition is used where  $V_{CC}$  is defined as a function of the maximum operating voltage and the absolute maximum rating (as recommended by JEDEC rules).

The  $V_{io}$  drift (in  $\mu\text{V}$ ) of the product after 1000 h of stress is tracked with parameters at different measurement conditions (see [Equation 6](#)).

#### Equation 6

$$V_{CC} = \max V_{op} \text{ with } V_{icm} = V_{CC} / 2$$

The long term drift parameter ( $\Delta V_{io}$ ), estimating the reliability performance of the product, is obtained using the ratio of the  $V_{io}$  (input offset voltage value) drift over the square root of the calculated number of months ([Equation 7](#)).

#### Equation 7

$$\Delta V_{io} = \frac{V_{io} \text{ drift}}{\sqrt{(\text{months})}}$$

Where  $V_{io}$  drift is the measured drift value in the specified test conditions after 1000 h stress duration.

## 4.7 High values of input differential voltage

In a closed loop configuration, which represents the typical use of an op amp, the input differential voltage is low (close to  $V_{io}$ ). However, some specific conditions can lead to higher input differential values, such as:

- operation in an output saturation state
- operation at speeds higher than the device bandwidth, with output voltage dynamics limited by slew rate.
- use of the amplifier in a comparator configuration, hence in open loop

Use of the TSX7191, TSX7191A in comparator configuration, especially combined with high temperature and long duration can create a permanent drift of  $V_{io}$ .

## 4.8 Capacitive load

Driving large capacitive loads can cause stability problems. Increasing the load capacitance produces gain peaking in the frequency response, with overshoot and ringing in the step response. It is usually considered that with a gain peaking higher than 2.3 dB an op amp might become unstable.

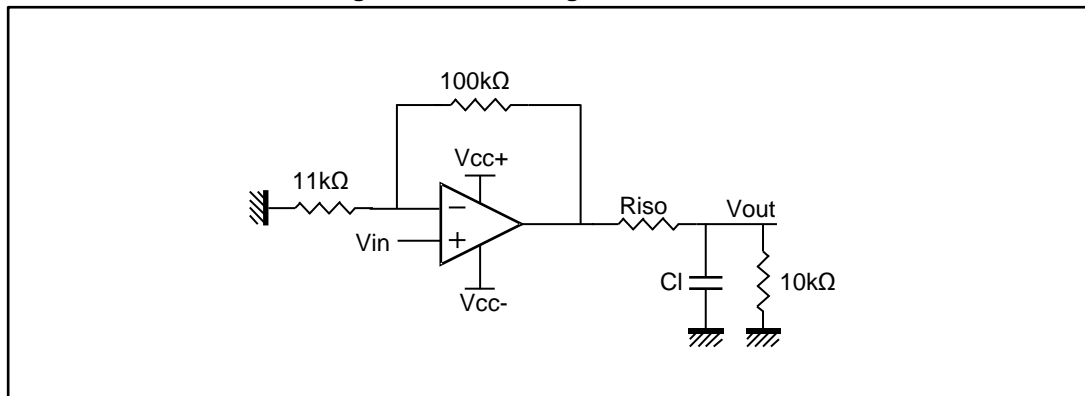

Generally, the unity gain configuration is the worst case for stability and the ability to drive large capacitive loads.

Figure 31 shows the serial resistor that must be added to the output, to make a system stable. Figure 32 shows the test configuration using an isolation resistor, Riso.

**Figure 31: Stability criteria with a serial resistor at different supply voltages**

**Figure 32: Test configuration for Riso**

## 4.9 PCB layout recommendations

Particular attention must be paid to the layout of the PCB, tracks connected to the amplifier, load, and power supply. The power and ground traces are critical as they must provide adequate energy and grounding for all circuits. The best practice is to use short and wide PCB traces to minimize voltage drops and parasitic inductance.

In addition, to minimize parasitic impedance over the entire surface, a multi-via technique that connects the bottom and top layer ground planes together in many locations is often used.

The copper traces that connect the output pins to the load and supply pins should be as wide as possible to minimize trace resistance.

## 4.10 Optimized application recommendation

It is recommended to place a 22 nF capacitor as close as possible to the supply pin. A good decoupling will help to reduce electromagnetic interference impact.

## 5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: **[www.st.com](http://www.st.com)**. ECOPACK® is an ST trademark.

## 5.1 SOT23-5 package information

Figure 33: SOT23-5 package outline

Table 6: SOT23-5 mechanical data

Ref.	Dimensions					
	Millimeters			Inches		
	Min.	Typ.	Max.	Min.	Typ.	Max.
A	0.90	1.20	1.45	0.035	0.047	0.057
A1			0.15			0.006
A2	0.90	1.05	1.30	0.035	0.041	0.051
B	0.35	0.40	0.50	0.014	0.016	0.020
C	0.09	0.15	0.20	0.004	0.006	0.008
D	2.80	2.90	3.00	0.110	0.114	0.118

## 6 Ordering information

Table 7: Order codes

Order code	Temperature range	Package	Packaging	Marking
TSX7191ILT	-40 to +125 °C	SOT23-5	Tape and reel	K34
TSX7191AILT				K196
TSX7191IYLT <sup>(1)</sup>				K199
TSX7191AIYLT <sup>(1)</sup>				K200

**Notes:**

<sup>(1)</sup>Qualification and characterization according to AEC Q100 and Q003 or equivalent, advanced screening according to AEC Q001 & Q 002 or equivalent are on-going.

## 7 Revision history

**Table 8: Document revision history**

Date	Revision	Changes
29-Sep-2014	1	Initial release
06-Jan-2015	2	Features: updated "stable when used with gain" feature. Applications: removed "DAC buffer" Electrical characteristics: replaced Figure 14
17-Mar-2017	3	Added part number TSX7191A

**Стандарт  
Электрон  
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
