**DESCRIPTION:**

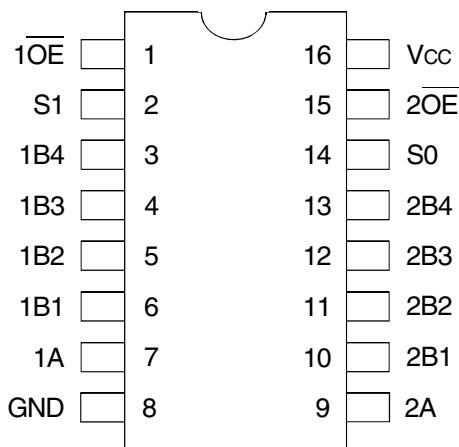

The CBTLV3253 is a dual 1-of-4 high-speed multiplexer/demultiplexer. The low on-state resistance of the switch allows connections to be made with minimal propagation delay.

The select ( $S_0$ ,  $S_1$ ) input controls the data flow. The multiplexer/demultiplexer switches are disabled when the output-enable ( $\overline{OE}$ ) input is high.

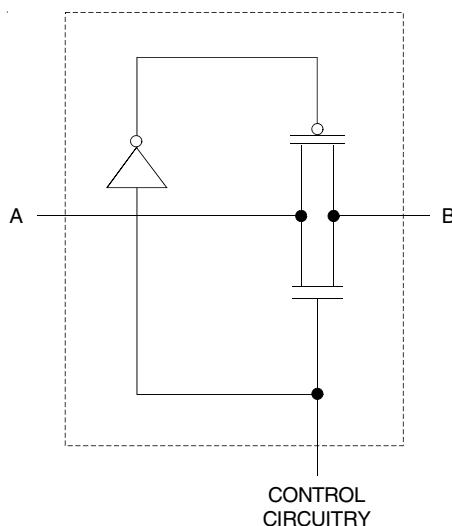

To ensure that the device is in high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{cc}$  through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

## NOTE:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Following Conditions Apply Unless Otherwise Specified:

Operating Conditions: TA = -40°C to +85°C

			I <sub>O</sub> = 24mA	—	5	7
		V <sub>I</sub> = 2.4V	I <sub>O</sub> = 15mA	—	10	15

## NOTES:

1. Typical values are at V<sub>CC</sub> = 3.3V, +25°C ambient.
2. The increase in supply current is attributable to each current that is at the specified voltage level rather than V<sub>CC</sub> or GND.
3. This is measured by the voltage drop between the A and B terminals at the indicated current through the switch. On-state resistance is determined by the lower of the voltages of the two (A or B) terminals.

## SWITCHING CHARACTERISTICS

Symbol	Parameter	V <sub>CC</sub> = 2.5V ± 0.2V		V <sub>CC</sub> = 3.3V ± 0.3V		Unit
		Min.	Max.	Min.	Max.	
t <sub>PD</sub> <sup>(1)</sup>	Propagation Delay A to B or B to A	—	0.15	—	0.25	ns

t <sub>DIS</sub>	Output Disable Time $\overline{OE}$ to A or B	1	5.5	1	5.4	ns

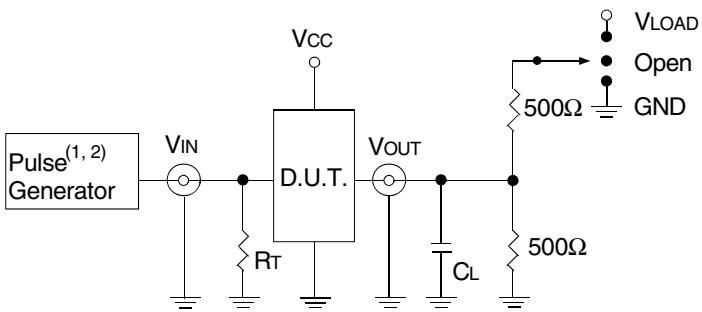

## NOTE:

1. The propagation delay is the calculated RC time constant of the typical on-state resistance of the switch and the specified load capacitance driven by an ideal voltage source (zero output impedance).
