**PACKAGING**

The M87C196KC/KD is available in a ceramic pin grid array, shown in Figure 3, and a leaded ceramic quad pack shown in Figure 4.

Figure 4. 68-Pin Ceramic Quad Flatpack

**PIN DESCRIPTIONS**

Symbol	Name and Function
V <sub>CC</sub>	Main supply voltage (5V).
V <sub>SS</sub>	Digital circuit ground (0V). There are three V <sub>SS</sub> pins, all of which must be connected.
V <sub>REF</sub>	Reference voltage for the A/D converter (5V). V <sub>REF</sub> is also the supply voltage to the analog portion of the A/D converter and the logic used to read Port 0. Must be connected for A/D and Port 0 to function.
ANGND	Reference ground for the A/D converter. Must be held at nominally the same potential as V <sub>SS</sub> .
V <sub>PP</sub>	Timing pin for the return from powerdown circuit. Connect this pin with a 1 μF capacitor to V <sub>SS</sub> and a 1 MΩ resistor to V <sub>CC</sub> . If this function is not used V <sub>PP</sub> may be tied to V <sub>CC</sub> . This pin is the programming voltage on the EPROM device.
XTAL1	Input of the oscillator inverter and of the internal clock generator.
XTAL2	Output of the oscillator inverter.
CLKOUT	Output of the internal clock generator. The frequency of CLKOUT is 1/2 the oscillator frequency.
$\overline{\text{RESET}}$	Reset input to the chip.
BUSWIDTH	Input for buswidth selection. If CCR bit 1 is a one, this pin selects the bus width for the bus cycle in progress. If BUSWIDTH is a 1, a 16-bit bus cycle occurs. If BUSWIDTH is a 0 an 8-bit cycle occurs. If CCR bit 1 is a 0, the bus is always an 8-bit bus.
NMI	A positive transition causes a vector through 203EH.
INST	Output high during an external memory read indicates the read is an instruction fetch. INST is valid throughout the bus cycle. INST is activated only during external memory accesses and output low for a data fetch.
$\overline{\text{EA}}$	Input for memory select (External Access). $\overline{\text{EA}}$ equal to a TTL-high causes memory accesses to locations 2000H through 5FFFH to be directed to on-chip EPROM. $\overline{\text{EA}}$ equal to a TTL-low causes accesses to those locations to be directed to off-chip memory.
ALE/ $\overline{\text{ADV}}$	Address Latch Enable or Address Valid output, as selected by CCR. Both pin options provide a signal to demultiplex the address from the address/data bus. When the pin is $\overline{\text{ADV}}$ , it goes inactive high at the end of the bus cycle. ALE/ $\overline{\text{ADV}}$ is activated only during external memory accesses.
$\overline{\text{RD}}$	Read signal output to external memory. $\overline{\text{RD}}$ is activated only during external memory reads.
$\overline{\text{WR}}$ / $\overline{\text{WRL}}$	Write and Write Low output to external memory, as selected by the CCR. $\overline{\text{WR}}$ will go low for every external write, while $\overline{\text{WRL}}$ will go low only for external writes where an even byte is being written. $\overline{\text{WR}}$ / $\overline{\text{WRL}}$ is activated only during external memory writes.
$\overline{\text{BHE}}$ / $\overline{\text{WRH}}$	Bus High Enable or Write High output to external memory, as selected by the CCR. $\overline{\text{BHE}} = 0$ selects the bank of memory that is connected to the high byte of the data bus. $\text{A0} = 0$ selects the bank of memory that is connected to the low byte of the data bus. Thus accesses to a 16-bit wide memory can be to the low byte only ( $\text{A0} = 0$ , $\overline{\text{BHE}} = 1$ ), to the high byte only ( $\text{A0} = 1$ , $\overline{\text{BHE}} = 0$ ), or both bytes ( $\text{A0} = 0$ , $\overline{\text{BHE}} = 0$ ). If the $\overline{\text{WRH}}$ function is selected, the pin will go low if the bus cycle is writing to an odd memory location. $\overline{\text{BHE}}$ / $\overline{\text{WRH}}$ is valid only during 16-bit external memory write cycles.

**PIN DESCRIPTIONS** (Continued)

Symbol	Name and Function
READY	Ready input to lengthen external memory cycles, for interfacing to slow or dynamic memory, or for bus sharing. When the external memory is not being used, READY has no effect.
HSI	Inputs to High Speed Input Unit. Four HSI pins are available: HSI.0, HSI.1, HSI.2 and HSI.3. Two of them (HSI.2 and HSI.3) are shared with the HSO Unit.
HSO	Outputs from High Speed Output Unit. Six HSO pins are available: HSO.0, HSO.1, HSO.2, HSI.3, HSO.4 and HSO.5. Two of them (HSO.4 and HSO.5) are shared with the HSI Unit.
Port 0	8-bit high impedance input-only port. These pins can be used as digital inputs and/or as analog inputs to the on-chip A/D converter.
Port 1	8-bit quasi-bidirectional I/O port.
Port 2	8-bit multi-functional port. All of its pins are shared with other functions in the M87C196KC.
Ports 3 and 4	8-bit bidirectional I/O ports with open drain outputs. These pins are shared with the multiplexed address/data bus which has strong internal pullups.
$\overline{\text{HOLD}}$	Bus Hold input requesting control of the bus.
$\overline{\text{HLDA}}$	Bus Hold acknowledge output indicating release of the bus.
$\overline{\text{BREQ}}$	Bus Request output activated when the bus controller has a pending external memory cycle.

**NOTES:**

(Notes apply to all specifications)

1. QBD (Quasi-bidirectional) pins include Port 1, P2.6 and P2.7.

2. Standard Outputs include AD0-15,  $\overline{RD}$ ,  $\overline{WR}$ , ALE,  $\overline{BHE}$ , INST, HSO pins, PWM/P2.5, CLKOUT, RESET, Ports 3 and 4, TXD/P2.0, and RXD (in serial mode 0). The  $V_{OH}$  specification is not valid for RESET. Ports 3 and 4 are open-drain outputs.

3. Standard Inputs include HSI pins, READY, BUSWIDTH, RXD/P2.1, EXTINT/P2.2, T2CLK/P2.3, and T2RST/P2.4.

4. Maximum current per pin must be externally limited to the following values if  $V_{OL}$  is held above 0.45V or  $V_{OH}$  is held below  $V_{CC} - 0.7V$ : $I_{OL}$  on Output pins: 10 mA $I_{OH}$  on quasi-bidirectional pins: self limiting $I_{OH}$  on Standard Output pins: 10 mA5. Maximum current per bus pin (data and control) during normal operation is  $\pm 3.2 \text{ mA}$ .

6. During normal (non-transient) conditions the following total current limits apply:

Port 1, P2.6  $I_{OL}$ : 29 mA  $I_{OH}$  is self limitingHSO, P2.0, RXD,  $\overline{RESET}$   $I_{OL}$ : 29 mA  $I_{OH}$ : 26 mAP2.5, P2.7,  $\overline{WR}$ ,  $\overline{BHE}$   $I_{OL}$ : 13 mA  $I_{OH}$ : 11 mAAD0-AD15  $I_{OL}$ : 52 mA  $I_{OH}$ : 52 mA $\overline{RD}$ , ALE, INST-CLKOUT  $I_{OL}$ : 13 mA  $I_{OH}$ : 13 mA

7. Violating these specifications in Reset may cause the part to enter test modes.

**EXPLANATION OF AC SYMBOLS**

Each symbol is two pairs of letters prefixed by "T" for time. The characters in a pair indicate a signal and its condition, respectively. Symbols represent the time between the two signal/condition points.

**Conditions:**

- H— High
- L— Low
- V— Valid
- X— No Longer Valid
- Z— Floating

**Signals:**

- A— Address
- B—  $\overline{BHE}$
- C— CLKOUT
- D— DATA
- G— Buswidth
- H—  $\overline{HOLD}$
- HA—  $\overline{HLDA}$

**L— ALE/ $\overline{ADV}$**

- BR—  $\overline{BREQ}$
- R—  $\overline{RD}$
- W—  $\overline{WR}/\overline{WRH}/\overline{WRL}$
- X— XTAL1
- Y— READY
- Q— Data Out

#### NOTES:

- Run Time Programming is done with  $F_{osc} = 6.0\text{ MHz to }12.0\text{ MHz}$ ,  $V_{REF} = 5\text{V} \pm 0.50\text{V}$ .  $T_A = +25^\circ\text{C to } \pm 5^\circ\text{C}$  and  $V_{PP} = 12.50\text{V}$ .
- This specification is for the Word Dump Mode. For programming pulses, use  $300 T_{OSC} + 100 \mu\text{s}$ .

### DC EPROM Programming Characteristics

Symbol	Description	Min	Max	Units
$I_{PP}$	$V_{PP}$ Supply Current (When Programming)		100	mA

#### NOTE:

$V_{PP}$  must be within 1V of  $V_{CC}$  while  $V_{CC} < 4.5\text{V}$ .  $V_{PP}$  must not have a low impedance path to ground of  $V_{SS}$  while  $V_{CC} > 4.5\text{V}$ .

### Erasing the M87C196KC/KD EPROM

Initially, and after each erasure, all bits of the M87C196KC/KD are in the "1" state. Data is introduced by selectively programming "0s" into the desired bit locations. Although only "0s" will be programmed, both "1s" and "0s" can be present in the data word. The only way to change a "0" to a "1" is by ultraviolet light erasure.

The erasure characteristics of the M87C196KC/KD are such that erasure begins to occur upon exposure to light with wavelengths shorter than approximately 4000 Angstroms (Å). It should be noted that sunlight and certain types of fluorescent lamps have wavelengths in the 3000–4000 Å range. Constant exposure to room level fluorescent lighting could erase the typical M87C196KC/KD in approximately 3 years, while it would take approximately 1 week to cause erasure when exposed to direct sunlight.

If the M87C196KC/KD is to be exposed to light for extended periods of time, opaque labels must be placed over the EPROM's window to prevent unintentional erasure.

The recommended erasure procedure for the M87C196KC/KD is exposure to shortwave ultraviolet light which has a wavelength of 2537 Å. The integrated dose (i.e., UV intensity × exposure time) for erasure should be a minimum of 15 Wsec/cm<sup>2</sup>. The erasure time with this dosage is approximately 35 to 60 minutes using an ultraviolet lamp with a 12000 μW/cm<sup>2</sup> power rating. The M87C196KC/KD should be placed within 1 inch of the lamp tubes during erasure. The maximum integrated dose an M87C196KC/KD can be exposed to without damage is 7258 Wsec/cm<sup>2</sup> (1 week @ 12000 μW/cm<sup>2</sup>). Exposure of the M87C196KC/KD to high intensity UV light for long periods may cause permanent damage.

### 10-BIT A/D CHARACTERISTICS

The speed of the A/D converter in the 10-bit mode can be adjusted by setting a clock prescaler on or off. At high frequencies more time is needed for the comparator to settle. The maximum frequency with the clock prescaler disabled is 6 MHz. The conversion times with the prescaler turned on or off is shown in the table below. The AD\_TIME register has not been characterized for the 10-bit mode.

The converter is ratiometric, so the absolute accuracy is dependent on the accuracy and stability

of  $V_{REF}$ .  $V_{REF}$  must be close to  $V_{CC}$  since it supplies both the resistor ladder and the digital section of the converter.

### A/D CONVERTER SPECIFICATIONS

The specifications given below assume adherence to the Operating Conditions section of this data sheet. Testing is performed with  $V_{REF} = 5.12V$ .

**M87C196KC DESIGN INFORMATION**
**M87C196KC Enhanced Feature Set over the M80C196KB**

1. The M87C196KC has twice the RAM of the M80C196KB and 16 Kbytes of EPROM. Also, a Vertical Register Windowing Scheme allows the extra 256 bytes of RAM to be used as registers. This greatly reduces the context switching time.
2. Peripheral Transaction Server (PTS). The PTS is an alternative way to service an interrupt, reducing latency and overhead. Each interrupt can be mapped to its PTS channel, which acts like a DMA channel. Each interrupt can now do a single or block transfer, without executing an interrupt service routine. Special PTS modes exist for the A/D converter, HSI, and HSO.
3. Two extra Pulse Width Modulated outputs. The M87C196KC has added 2 PWM outputs that are functionally compatible to the 80C196KB PWM.
4. Timer2 Internal Clocking. Timer2 can now be clocked with an internal source, every 1 or 8 state times.
5. The A/D can now perform an 8- as well as a 10-bit conversion. This trades off resolution for a faster conversion time.
6. Additional On-chip Memory Security. Two UPROM (Uneraseable Programmable Read Only Memory) bits can be programmed to disable the bus controller for external code and data fetches. Once programmed, a UPROM bit cannot be erased. By shutting off the bus controller for external fetches, no one can try and gain access to your code by executing from external memory.
7. New Instructions. The M87C196KC has 5 new instructions. An exchange (XCHB/XCHW) instruction swaps two memory locations, an Interruptable Block Move Instruction (BMOVI), a Table Indirect Jump (TIJMP) instruction, and two instructions for enabling and disabling the PTS (EPTS/DPTS).

**M80C196KB TO M87C196KC DESIGN CONSIDERATIONS**

1. Memory Map. The M87C196KC has 512 bytes of RAM/SFRs and 16K of EPROM. The extra 256 bytes of RAM will reside in locations 100H–1FFH and the extra 8K of EPROM will reside in locations 4000H–5FFFH. These locations are external memory on the M80C196KB.
2. EPROM programming. The M87C196KC has a different programming algorithm to support 16K of on-board memory.
3. ONCE Mode Entry. The ONCE mode is entered on the M87C196KC by driving the TXD pin low on the rising edge of RESET. The TXD pin is held high by a pullup that is specified at 1.4 mA and remain at 2.0V. This Pullup must not be overridden or the M87C196KC will enter the ONCE mode.
4. During the bus HOLD state, the M87C196KC weakly holds RD, WR, ALE, BHE and INST in their inactive states. The 80C196KB only holds ALE in its inactive state.

5. A RESET pulse from the M87C196KC is 16 states rather than 4 states as on the 80C196KB (i.e., a watchdog timer overflow). This provides a longer RESET pulse for other devices in the system.
6. The CDE pin on the KB has become a V<sub>SS</sub> pin on the KC to support 16 MHz operation.

**M87C196KC ERRATA**

1. **Missed EXTINT on P0.7.**  
The 80C196KC20 could possibly miss an EXTINT on P0.7. See faxback #2049.
2. HIS\_\_MODE divide-by-eight.

## M87C196KD DESIGN INFORMATION

### M87C196KD Enhancements over the M87C196KC

The M87C196KD is an enhanced, pin-for-pin compatible upgrade to the M87C196KC. The M87C196KD offers the same functionality, packages, and pin-outs as the M87C196KC with twice the on-chip EPROM and register RAM.

1. Doubling the on-chip EPROM to 32 KBytes allows for larger on-chip programs.
2. Doubling the on-chip RAM to 1000 bytes allows for faster and more optimized code execution.

### M87C196KC TO M87C196KD DESIGN CONSIDERATIONS

Due to the added memory, a few memory-specific functions have been modified on the M87C196KD.

1. The AC characteristic  $\overline{RD}$  Low to Address Float ( $T_{RLAZ}$ ) maximum has been increased from 15 ns on the M87C196KC to 30 ns on the M87C196KD.
2. The memory map is expanded to accommodate the additional memory. Because the added memory resides in memory locations that were always external to the M87C196KC, M87C196KC code may have to be modified to run on the M87C196KD.
3. The vertical windowing map is extended to allow all 1000 bytes of register RAM to be windowed into the lower register file.
4. The M87C196KD has a different autoprogramming algorithm to support 32 KBytes of on-chip EPROM.

**NEW M87C196KC/KD FEATURE**

A CLKOUT disable bit has been added to the IOC3 SFR. This can be used to reduce noise in systems that do not require the CLKOUT signal. Figure 17 indicates the placement of the new bit.

**Figure 17. M87C196KD New SFR Bit (CLKOUT Disable)**

**DATASHEET REVISION HISTORY**

The changes made since the October 1992 revision of the M87C196KC datasheet (271116-004) are as follows:

1. Added M87C196KD information.
2. Deleted the memory map figure.\*
3. Deleted the horizontal windowing figure.\*
4. Deleted the SFR bit summaries.\*
5. Added the new CLKOUT disable feature.
6. Modified the  $V_{IH2}$  and  $I_{CC}$  DC specifications.
7. Modified the  $T_{LLYV}$ ,  $T_{LLGV}$ ,  $T_{RLDV}$ ,  $T_{RHDZ}$ ,  $T_{LLCH}$ ,  $T_{LHLL}$ ,  $T_{LLAX}$ ,  $T_{LLRL}$ ,  $T_{RLAZ}$ , and  $T_{WHQX}$  AC specifications.
8. Modified the  $T_{HALBZ}$  and  $T_{HAHAX}$  HOLD/HLDA specifications.
9. Added the package thermal characteristics.

## Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
