Low-power D-type flip-flop; positive-edge trigger; 3-state

Rev. 04 — 26 June 2009

Product data sheet

## 1. General description

The 74AUP1G374 provides the single D-type flip-flop with 3-state output. The flip-flop will store the state of data input (D) that meet the set-up and hold times requirements on the LOW-to-HIGH CP transition. When pin  $\overline{OE}$  is LOW, the contents of the flip-flop is available at the (Q) output. When pin  $\overline{OE}$  is HIGH, the output goes to the high-impedance OFF-state. Operation of input pin  $\overline{OE}$  does not affect the state of the flip-flop.

Schmitt trigger action at all inputs makes the circuit tolerant to slower input rise and fall times across the entire  $V_{CC}$  range from 0.8 V to 3.6 V. This device ensures a very low static and dynamic power consumption across the entire  $V_{CC}$  range from 0.8 V to 3.6 V.

This device is fully specified for partial power-down applications using  $I_{OFF}$ . The  $I_{OFF}$  circuitry disables the output, preventing the damaging backflow current through the device when it is powered down.

 $P_D = C_{PD} \times V_{CC}^2 \times f_i \times N + \Sigma(C_L \times V_{CC}^2 \times f_o)$  where:  
 f<sub>i</sub> = input frequency in MHz;  
 f<sub>o</sub> = output frequency in MHz;

Measurement points are given in [Table 9](#).  
 The shaded areas indicate when the input is permitted to change for predictable output performance.  
 Logic levels:  $V_{OL}$  and  $V_{OH}$  are typical output voltage levels that occur with the output load.
