DESCRIPTION

The UPC8172TB is a silicon monolithic integrated circuit designed as a frequency up-converter for a wireless transceiver transmitter stage. This IC is manufactured using the 30 GHz f_{max} UHS0 (Ultra High Speed Process) silicon bipolar process. This IC has the same circuit current as the conventional UPC8106TB, but operates at higher frequency, higher gain and lower distortion. Such performance and operation from a 3 volts supply makes this device ideal for mobile communications and wireless LAN applications.

Stringent quality assurance and test procedures ensure the highest reliability and performance.

APPLICATIONS

- PCS1900 MHz
- 2.4 GHz band transmitter/receiver system (wireless LAN, etc.)

PIN FUNCTIONS (Voltage is measured at V_{CC} = V_{PS} = V_{RFOUT} = 3.0 V)

Pin No.	Pin Name	Applied Voltage (V)	Pin Voltage (V)	Function and Explanation	Equivalent Circuit
1	IFinput	—	1.4	This pin is the IF input pin to the double balanced mixer (DBM). The input is designed as a high impedance. The circuit helps suppress spurious signals. Also this symmetrical circuit can keep specified performance insensitive to process-condition distribution. For that reason, a double balanced mixer is adopted.	2	GND	GND	—	GND pin. Ground pattern on the board should be formed as wide as possible. Track length should be kept as short as possible to minimize ground inductance.	
3	LOinput	–	2.3	Local input pin. Recommendable input level is -10 to 0 dBm.	
5	V_{CC}	2.7 to 3.3	—	Supply voltage pin.	
6	RFoutput	Same bias as V_{CC} through external inductor	—	This pin is the RF output from the double balanced mixer. This pin is designed as an open collector. Due to the high impedance output, this pin should be externally equipped with an LC matching circuit to the next stage.	
4	PS	V_{CC}/GND		Power save control pin. Bias controls operate as follows: Pin Bias: V_{CC} — Control: Operation Pin Bias: GND — Control: Power Save
