

# NCN8024

## Smart Card Interface IC

The NCN8024 is a single smart card interface IC. It is dedicated for 3.0 V/5.0 V smart card reader/writer applications.

The device is fully compatible with the ISO 7816-3 and EMV standards as well as with standards specifying conditional access in Set-Top-Box (STB) including NDS.

For details regarding device implementation refer to application note AND8452/D, available upon request (please contact your local ON Semiconductor sales office or representative).

### Features

- Single IC Card Interface
- Fully Compatible with ISO 7816-3, EMV and Related Standards Including NDS
- Three Bidirectional Buffered I/O Level Shifters (C4, C7 and C8 Card Pins)
- 3.0 V or 5.0 V  $\pm 5\%$  Regulated Card Power Supply such as  $I_{CC} \leq 75$  mA at  $3.3$  V  $\leq V_{DD} \leq 5.5$  V
- Independent Power Supply Range on Controller Interface ( $2.7$  V  $< V_{DD} < 5.5$  V)
- Handles 3.0 V and 5.0 V Smart Cards
- Thermal and Short Circuit Protection on all Card Pins
- Support up to 18 MHz Clock with Internal Division Ratio 1/1, 1/2, 1/4 and 1/8 through CLKDIV1 and CLKDIV2 Pins
- ESD Protection on Card Pins up to 8 kV+ (Human Body Model)
- Activation/Deactivation Sequences (ISO7816)
- Fault Protection Mechanisms Enabling Automatic Device Deactivation in Case of Overload, Overheating, Card Take-off or Power Supply Drop-out
- Interrupt Signal  $\overline{INT}$  for Card Presence and Faults
- External Undervoltage Lockout Threshold Adjustment on  $V_{DD}$  (PORADJ Pin)
- Available in 2 Package Formats: SOIC-28 and TSSOP-28
- These are Pb-Free Devices

### Typical Application

- Set-Top Boxes Conditional Access & Pay-TV
- Conditional Access Modules (CAM)
- POS / ATM
- Access Control, Identification

### PIN FUNCTION AND DESCRIPTION

Pin #	Name	Type	Description
1	CLKDIV1	Input	This pin coupled with CLKDIV2 is used to program the clock frequency division ratio (Table 1).
2	CLKDIV2	Input	This pin coupled with CLKDIV1 is used to program the clock frequency division ratio (Table 1).
3	5V/3V	Input	Allows selecting card V <sub>CC</sub> power supply voltage. CRD_V <sub>CC</sub> = 5 V when 5V/3V = HIGH or 3 V when 5V/3V = LOW
4	GNDP	GND	DC/DC Converter Power Supply Ground
5	C2	Power	DC/DC Converter Capacitor pin number 2 – A 100 nF capacitor is connected between this pin and pin C1. The capacitor has to feature an ESR lower than 100 mΩ
6	VDDP	Power	DC/DC Converter Power Supply Voltage
7	C1	Power	DC/DC Converter Capacitor pin number 1 – A 100 nF capacitor is connected between this pin and pin C2. The capacitor has to feature an ESR lower than 100 mΩ
8	VUP	Power	Charge-pump output – a very low ESR 100 nF capacitor (ESR < 100 mΩ) is connected between this pin and GNDP
9	CRD_PRES	Input	Card presence pin active (card present) when CRD_PRES = Low. A built-in debounce timer of about 8 ms is activated when a card is inserted.
10	CRD_PRES	Input	Card presence pin active (card present) when CRD_PRES = High. A built-in debounce timer of about 8 ms is activated when a card is inserted.

# PIN FUNCTION AND DESCRIPTION

Pin #	Name	Type	Description
11	CRD_I/O	Input/Output	This pin handles the connection to the serial I/O (C7) of the card connector. A bi-directional level translator adapts the serial I/O signal between the card and the micro controller. An 11 k $\Omega$ (typical) pullup resistor to CRD_VCC provides a High impedance state for the smart card I/O link.
12	CRD_AUX2	Input/Output	This pin handles the connection to the chip card's serial auxiliary AUX2 I/O pin (C8). A bi-directional level translator adapts the serial I/O signal between the card and the micro controller. An 11 k $\Omega$ (typical) pullup resistor to CRD_VCC provides a High impedance state for the smart card C8 pin.
13	CRD_AUX1	Input/Output	This pin handles the connection to the chip card's serial auxiliary AUX1 I/O pin (C4). A bi-directional level translator adapts the serial I/O signal between the card and the micro controller. An 11 k $\Omega$ (typical) pullup resistor to CRD_VCC provides a High impedance state for the smart card C4 pin.
14	CRD_GND	GND	Card Ground
15	CRD_CLK	Output	This pin is connected to the CLOCK card connector's pin (Chip card's pin C3). The Clock signal comes from the CLKIN input through clock dividers and level shifter.
16	CRD_RST	Output	This pin is connected to the chip card's RESET pin (C2) through the card connector. A level translator adapts the external Reset (RSTIN) signal to the smart card.
17	CRD_VCC	Power	This pin is connected to the smart card power supply pin. An internal DC/DC converter is programmable using the pin 5V/3V to supply either 5 V or 3 V output voltage. An external distributed ceramic capacitor (200 nF + 330 nF typical recommended) must be connected across CRD_VCC and CRD_GND. This set of capacitor (if distributed) must be low ESR (< 100 m $\Omega$ ).
18	PORADJ	Input	Power-on reset threshold adjustment input pin for changing the reset threshold with an external resistor power divider. Recommended to be connected to ground when unused.
19	CMDVCC	Input	Command VCC pin. Activation sequence Enable/Disable pin (active Low). The activation sequence is enabled by toggling CMDVCC High to Low and when a card is present.
20	RSTIN	Input	This Reset input connected to the host and referred to VDD (microcontroller side), is connected to the smart card Reset pin through the internal level shifter which translates the level according to the CRD_VCC programmed value.
21	VDD	Power	This pin is connected to the system controller power supply. It configures the level shifter input stage to accept the signals coming from the controller. A 0.1 $\mu$ F capacitor shall be used to bypass the power supply voltage. When VDD is below 2.35 V typical the card pins are disabled.
22	GND	GND	Ground
23	INT	Output	The interrupt request is activated LOW on this pin. This is enabled when a card is present and the card presence is detected by CRD_PRES or CRD_PRES pins. Similarly an interrupt is generated when CRD_VCC is overloaded. 20 k $\Omega$ typical integrated pullup resistor to VDD.
24	CLKIN	Input	Clock Input for External Clock
25	NC		Unconnected
26	I/Ouc	Input/Output	This pin is connected to an external micro-controller. A bi-directional level translator adapts the serial I/O signal between the smart card and the external controller. A built-in constant 11 k $\Omega$ (typical) resistor provides a high impedance state.
27	AUX1uc	Input/Output	This pin is connected to an external micro-controller. A bi-directional level translator adapts the serial C4 signal between the smart card and the external controller. A built-in constant 11 k $\Omega$ (typical) resistor provides a high impedance state.
28	AUX2uc	Input/Output	This pin is connected to an external micro-controller. A bi-directional level translator adapts the serial C8 signal between the smart card and the external controller. A built-in constant 11 k $\Omega$ (typical) resistor provides a high impedance state.

## ATTRIBUTES

Characteristics	Values
ESD protection Human Body Model (HBM) (Note 1) Card Pins (Card Interface Pins 9 – 17) All Other Pins Machine Model (MM) Card Pins (Card Interface Pins 9 – 17) All Other Pins	8 kV 2 kV 400 V 150 V
Moisture sensitivity (Note 2) SOIC–28 and TSSOP–28	Level 3
Flammability Rating Oxygen Index: 28 to 34	UL 94 V–0 @ 0.125 in
Meets or exceeds JEDEC Spec EIA/JESD78 IC Latch–up Test	

- Human Body Model (HBM),  $R = 1500\ \Omega$ ,  $C = 100\ \text{pF}$ .
- For additional information, see Application Note AND8003/D.

## MAXIMUM RATINGS (Note 3)

Rating	Symbol	Value	Unit
DC/DC Converter Power Supply Voltage	$V_{DDP}$	$-0.3 \leq V_{DDP} \leq 5.5$	V
Power Supply from Microcontroller Side	$V_{DD}$	$-0.3 \leq V_{DD} \leq 5.5$	V
External Card Power Supply	$CRD\_V_{CC}$	$-0.3 \leq CRD\_V_{CC} \leq 5.5$	V
Charge Pump Output	$V_{UP}$	$-0.3 \leq V_{UP} \leq 5.5$	
Digital Input Pins	$V_{in}$	$-0.3 \leq V_{in} \leq V_{DD}$	V
Digital Output Pins (I/Ouc, AUX1uc, AUX2uc, INT)	$V_{out}$	$-0.3 \leq V_{out} \leq V_{DD}$	V
Smart Card Output Pins	$V_{out}$	$-0.3 \leq V_{out} \leq CRD\_V_{CC}$	V
Thermal Resistance Junction–to–Air SOIC–28 TSSOP–28	$R_{\theta JA}$	75 76	°C/W
Operating Ambient Temperature Range	$T_A$	–40 to +85	°C
Operating Junction Temperature Range	$T_J$	–40 to +125	°C
Maximum Junction Temperature	$T_{Jmax}$	+125	°C
Storage Temperature Range	$T_{stg}$	–65 to +150	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- Maximum electrical ratings are defined as those values beyond which damage to the device may occur at  $T_A = +25^\circ\text{C}$

**POWER SUPPLY SECTION** ( $V_{DD} = 3.3\text{ V}$ ;  $V_{DDP} = 5\text{ V}$ ;  $T_{amb} = 25^{\circ}\text{C}$ ;  $F_{CLKIN} = 10\text{ MHz}$ )

Pin	Symbol	Rating	Min	Typ	Max	Unit
6	$V_{DDP}$	DC/DC Converter Power Supply, $CRD\_V_{CC} = 3\text{ V}$ and $5\text{ V}$ with DC Load Such as $ I_{CC}  \leq 75\text{ mA}$ $ I_{CC}  \leq 20\text{ mA}$	3.3 3.0	5.0	5.5 5.5	V

**DC/DC CONVERTER**

	$F_{CLK}$	DC/DC Converter Clock Frequency when Card Active (Note 4)	2.2		3.2	MHz
8	$V_{UP}$	Output Voltage on pin $V_{UP}$ (average value) $CRD\_V_{CC} = 5\text{ V}$ $CRD\_V_{CC} = 3\text{ V}$	5.0 5.0	5.23 5.23	5.5 5.5	V
17	$C_{CRD\_V_{CC}}$	Output Capacitance on card power supply $CRD\_V_{CC}$ (Notes 4 and 5)	300	220 + 320	1000	nF
17	$CRD\_V_{CC}$	Output Card Supply Voltage @ $4.5\text{ V} < V_{DDP} < 5.5\text{ V}$ (including ripple) $CRD\_V_{CC} = 3.0\text{ V}$ @ $I_{load} \leq 65\text{ mA}$ $CRD\_V_{CC} = 5.0\text{ V}$ @ $I_{load} \leq 65\text{ mA}$	2.85 4.75	3.00 5.00	3.15 5.25	V

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

- Guaranteed by design and characterization
- These values take into account the tolerance of the cms capacitor used. The allowed values are single or distributed capacitor combination not exceeding  $1.0\text{ }\mu\text{F}$  with  $220\text{ nF} + 330\text{ nF}$  typical and recommended. It is recommended to use X5R or X7R-type capacitors with very low ESR ( $< 100\text{ m}\Omega$ ) for optimal performances.

## POWER SUPPLY

The NCN8024 smart card interface has two power supplies:  $V_{DD}$  and  $V_{DDP}$ .

$V_{DD}$  is usually common to the system controller and the interface. The applied  $V_{DD}$  ranges from 2.7 V up to 5.5 V. If  $V_{DD}$  goes below 2.35 V typical ( $UVLO_{VDD}$ ) a power-down sequence is automatically performed. In that case the interrupt ( $\overline{\text{INT}}$ ) pin is set Low.

A built-in charge-pump-based DC/DC converter followed by a Low Drop-Out (LDO) regulator is used to provide the 3 V or 5 V power supply voltage ( $CRD\_VCC$ ) to the card.  $V_{DDP}$  is the converter's input voltage. VUP is the charge-pump converter's output. It is connected to the LDO input. A reservoir capacitor of 100 nF is connected to VUP.  $CRD\_VCC$  is the LDO output. Even if the converter can operate with a single output reservoir capacitor as low as 100 nF at  $CRD\_VCC$ , it is recommended to use a capacitor of at least 320 nF in order to satisfy the datasheet specifications. The best recommended combination guaranteeing optimal performances consists in a distributed set of capacitors 220 nF + 330 nF (in particular recommended for optimally satisfying the NDS standard). To minimize  $dI/dt$  effects, the fly capacitor (100 nF) and the reservoir capacitors VUP and  $CRD\_VCC$  have to be connected as close as possible to the corresponding device's pin and feature very low ESR values (lower than 50 m $\Omega$ ). The fly capacitor is connected between C1 and C2. The decoupling capacitors on  $V_{DD}$  and  $V_{DDP}$  respectively 100 nF and 10  $\mu\text{F}$  have also to be connected close to the respective IC pins.

The  $CRD\_VCC$  pin can source up to 75 mA continuously over the  $V_{DDP}$  range (from 3.3 V to 5.5 V), the absolute

maximum current being internally limited below 150 mA (Typical at 110 mA).  $CRD\_VCC$  can stay in the range 4.6 V – 5.30 V during current transient up to 200 mA (peak current) over less than 400 ns of current pulse duration such as the charge transient is lower than 40 nAs.

There's no specific sequence for applying  $V_{DD}$  or  $V_{DDP}$ . They can be applied to the interface in any sequence. After powering the device  $\overline{\text{INT}}$  remains Low until a card is inserted.

## SUPPLY VOLTAGE MONITORING

The supply voltage monitoring block includes the Power On Reset (POR) circuitry and the under voltage lockout ( $UVLO$ ) detection ( $V_{DD}$  voltage dropout detection). PORADJ pin allows the user, according to the considered application, to adjust the  $V_{DD}$   $UVLO$  threshold. If not used PORADJ pin is connected to Ground.

The input supply voltage is continuously monitored to prevent under voltage operation. At power up, the system initializes the internal logic during POR timing and no further signal can be provided or supported during this period. Such initialization takes place when the input voltage rises between 2 V to 2.6 V about typical.

The system is ready to operate when the input voltage has reached the minimum 2.7 V. Considering this, the NCN8024 will detect an Under-Voltage situation when the input supply voltage will drop below 2.35 V typical. When  $V_{DD}$  goes down below the  $UVLO$  falling threshold a deactivation sequence is performed.

The device is inactive during power-on and power-off of the  $V_{DD}$  supply (8 ms reset pulse).

PORADJ pin is used to modify the UVLO threshold according to the below relationship considering an external resistor divider R1 / R2 (see block diagram Figure 1):

$$UVLO = \frac{R1 + R2}{R2} V_{POR}$$

If PORADJ is connected to Ground the  $V_{DD}$  UVLO threshold ( $V_{DD}$  falling) is typically 2.35 V. In some cases it can be interesting to adjust this threshold at a higher value and by the way increase the  $V_{DD}$  supply dropout detection level which enables a deactivation sequence if the  $V_{DD}$  voltage is too low.

For example, there are microcontrollers for which the minimum supply voltage insuring a correct operating is higher than 2.55 V, increasing  $UVLO_{VDD}$  ( $V_{DD}$  falling) is consequently necessary. Considering for instance a resistor bridge with  $R1 = 56 \text{ k}\Omega$ ,  $R2 = 42 \text{ k}\Omega$  and  $V_{POR} = 1.18 \text{ V}$  typical the  $V_{DD}$  dropout detection level can be increased up to:

$$UVLO = \frac{59k + 42k}{42k} V_{POR} = 2.75 \text{ V}$$

The minimum dropout detection voltage should be higher than 2 V.

The maximum detection level may be up to  $V_{DD}$ .

#### CLOCK DIVIDER:

The input clock can be divided by 1/1, 1/2, 1/4, or 1/8, depending upon the specific application, prior to be applied to the smart card driver. These division ratios are programmed using pins CLKDIV1 and CLKDIV2 (see Table 1). The input clock is provided externally to pin CLKIN.

**Table 1. Clock Frequency Programming**

CLKDIV1	CLKDIV2	F <sub>CRD_CLK</sub>
0	0	CLKIN/8
0	1	CLKIN / 4
1	0	CLKIN
1	1	CLKIN / 2

The clock input stage (CLKIN) can handle a 27 MHz maximum frequency signal (considering a division ratio  $\geq 2$ ). Of course, the ratio must be defined by the user to cope with Smart Card considered in a given application

In order to avoid any duty cycle out of the 45% / 55% range specification, the divider is synchronized by the last flip flop, thus yielding a constant 50% duty cycle, whatever be the divider ratio 1/2, 1/4 or 1/8. On the other hand, the output signal Duty Cycle cannot be guaranteed 50% if the division ratio is 1 and if the input Duty Cycle signal is not within the 46 – 56% range at the CLKIN input.

When the signal applied to CLKIN is coming from the external controller, the clock will be applied to the card under the control of the microcontroller or similar device after the activation sequence has been completed.

#### DATA I/O, AUX1 and AUX2 LEVEL SHIFTERS

The three bidirectional level shifters I/O, AUX1 and AUX2 adapt the voltage difference that might exist between the micro-controller and the smart card. These three channels are identical. The first side of the bidirectional level shifter dropping Low (falling edge) becomes the driver side until the level shifter enters again in the idle state pulling High CRD\_IO and I/Ouc.

Passive 11 k $\Omega$  pull-up resistors have been internally integrated on each terminal of the bidirectional channel. In addition with these pull-up resistors, an active pull-up circuit provides a fast charge of the stray capacitance.

The current to and from the card I/O lines is limited internally to 15 mA and the maximum frequency on these lines is 1 MHz.

#### STANDBY MODE

After a Power-on reset, the circuit enters the standby mode. A minimum number of circuits are active while waiting for the microcontroller to start a session:

- All card contacts are inactive
- Pins I/Ouc, AUX1uc and AUX2uc are in the high-impedance state (11 k $\Omega$  pull-up resistor to  $V_{DD}$ )
- Card pins are inactive and pulled Low
- Supply Voltage monitoring is active
- The internal DC/DC converter oscillator is running.

#### POWER-UP

In the standby mode the microcontroller can check the presence of a card using the signals INT and CMDVCC as shown in Table 2:

**Table 2. Card Presence State**

INT	CMDVCC	State
HIGH	HIGH	Card present
LOW	HIGH	Card not present

If a card is detected present ( $\overline{\text{CRD\_PRES}}$  or CRD\_PRES active) the controller can start a card session by pulling CMDVCC Low. Card activation is run (t0, Figure 5). This Power-Up Sequence makes sure all the card related signals are LOW during the CRD\_VCC positive going slope. These lines are validated when CRD\_VCC is stable and above the minimum voltage specified. When the CRD\_VCC voltage reaches the programmed value (3.0 V or 5.0 V), the circuit activates the card signals according to the following sequence (Figure 5):

- CRD\_VCC is powered-up at its nominal value (t1)
- I/O, AUX1 and AUX2 lines are activated (t2)
- Then Clock channel is activated and the clock signal is applied to the card (t3)
- Finally the Reset level shifter is enabled (t4)

The clock can also be applied to the card using a RSTIN mode allowing controlling the clock starting by setting RSTIN Low (Figure 4). Before running the activation sequence, that is before setting Low  $\overline{\text{CMDVCC}}$  RSTIN is set High. In these initial conditions CRD\_CLK starts when RSTIN is pulled Low. This allows a precise count of clock pulses before toggling CRD\_RST High for ATR (Answer To Reset) request.

The internal activation sequence activates the different channels according to a specific hardware built-in sequencing internally defined but at the end the actual activation sequencing is the responsibility of the application software and can be redefined by the micro-controller to comply with the different standards and the different ways the standards manage this activation (for example light differences exist between the EMV and the ISO7816 standards).

**Figure 4. Activation Sequence – RSTIN mode (RSTIN Starting High)**

**Figure 5. Activation Sequence – Normal Mode**

## POWER-DOWN

When the communication session is completed the NCN8024 runs a deactivation sequence by setting High  $\overline{\text{CMDVCC}}$ . The below power down sequence is executed:

- CRD\_RST is forced to Low

- CRD\_CLK is set Low 12  $\mu\text{s}$  after CRD\_RST.
- CRD\_IO, CRD\_AUX1 and CRD\_AUX2 are pulled Low
- Finally CRD\_VCC supply can be shut-off.

Figure 6. Deactivation Sequence

## FAULT DETECTION

In order to protect both the interface and the external smart card, the NCN8024 provides security features to prevent failures or damages as depicted here after.

- Card extraction detection
- $V_{DD}$  under voltage detection
- Short-circuit or overload on CRD\_VCC

- Card pin current limitation: in the case of a short circuit to ground. No feedback is provided to the external MPU.
- DC/DC operation: the internal circuit continuously senses the CRD\_VCC voltage (in the case of either over or under voltage situation).
- DC/DC operation: under-voltage detection on  $V_{DDP}$  or overload on VUP
- Overheating

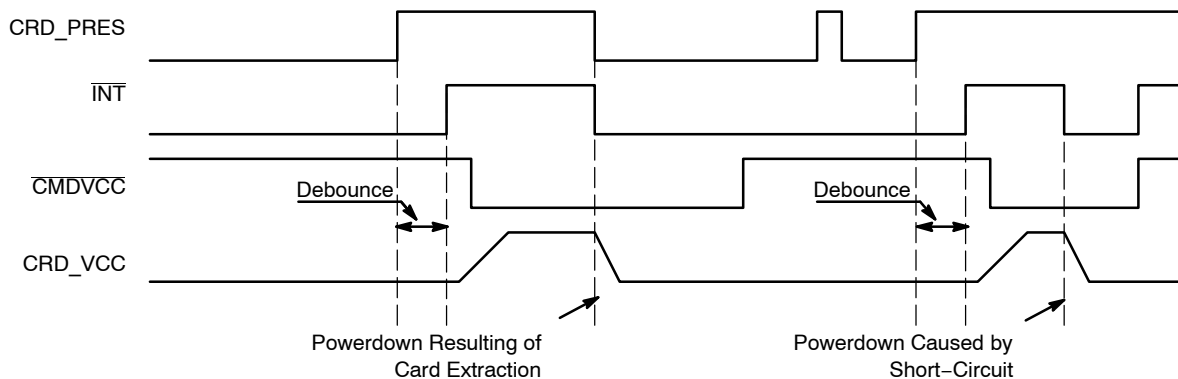

Figure 7. Fault Detection and Interrupt Management

### Interrupt Pin Management:

A card session is opened by toggling  $\overline{\text{CMDVCC}}$  High to Low.

Before a card session,  $\overline{\text{CMDVCC}}$  is supposed to be in a High position.  $\overline{\text{INT}}$  is Low if no card is present in the card connector (Normally open or normally closed type).  $\overline{\text{INT}}$  is High if a card is present. If a card is inserted ( $\overline{\text{INT}} = \text{High}$ ) and if  $V_{DD}$  drops below the UVLO threshold then  $\overline{\text{INT}}$  pin drops Low immediately. It turns back High when  $V_{DD}$  increases again over the UVLO limit (including hysteresis), a card being still present.

During a card session,  $\overline{\text{CMDVCC}}$  is Low and  $\overline{\text{INT}}$  pin goes Low when a fault is detected. In that case a deactivation is immediately and automatically performed (see Figure 6). When the microcontroller resets  $\overline{\text{CMDVCC}}$  to High it can sense the  $\overline{\text{INT}}$  level again after having got completed the deactivation.

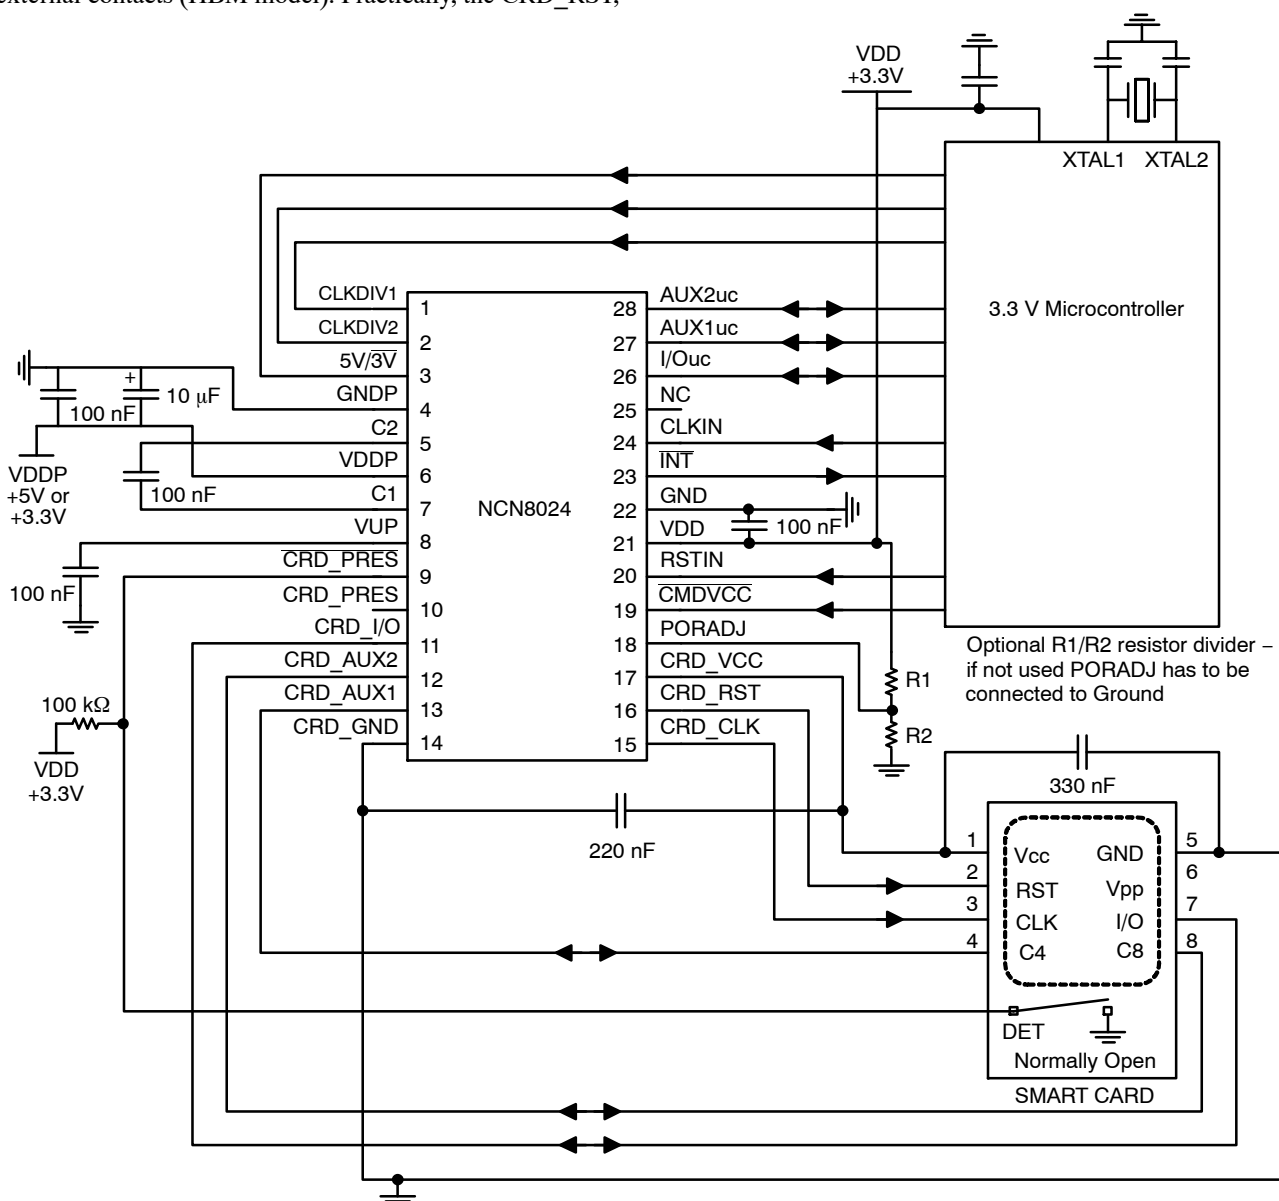

As illustrated by Figure 7 the device has a debounce timer of 8 ms typical duration. When a card is inserted, output  $\overline{\text{INT}}$  goes High only at the end of the debounce time. When the card is removed a deactivation sequence is automatically and immediately performed and  $\overline{\text{INT}}$  goes Low.

**NCN8024**

## ESD PROTECTION

The NCN8024 includes devices to protect the pins against the ESD spikes voltages. To cope with the different ESD voltages developed across these pins, the built in structures have been designed to handle either 2 kV, when related to the micro controller side, or 8 kV when connected with the external contacts (HBM model). Practically, the CRD RST,

CRD\_CLK, CRD\_IO, CRD\_AUX1, CRD\_AUX2, CRD\_PRES and  $\overline{\text{CRD\_PRES}}$  pins can sustain 8 kV. The CRD\_VCC pin has the same ESD protection and can source up to 75 mA continuously, the absolute maximum current being internally limited with a max at 150 mA. The CRD\_VCC current limit depends on  $V_{DDP}$  and CRD\_VCC.

**Стандарт  
Электрон  
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
