AS3675

Flexible Lighting Management Unit (Charge Pump, DCDC, 13 Current Sinks, ADC, LED Test, LDO, Audio Controlled Light)

1 General Description

The AS3675 is a highly-integrated CMOS Power and Lighting Management Unit for mobile telephones, and other 1-cell Li+ or 3-cell NiMH powered devices.

The AS3675 incorporates one Step Up DC/DC Converter for white backlight LEDs, one high-power Charge Pump, one Analog-to-Digital Converter, 13 current sinks, the RGB and white LEDs can be controlled by an audio input, LED in-circuit function test, a two wire serial interface, and control logic all onto a single device. Output voltages and output currents are fully programmable.

The AS3675 is part of the austriamicrosystems AS3676, AS3687/87XM and AS3689 lighting management units family. It is software compatible to AS3687/87XM and AS3689 and pin and software compatible to AS3676.

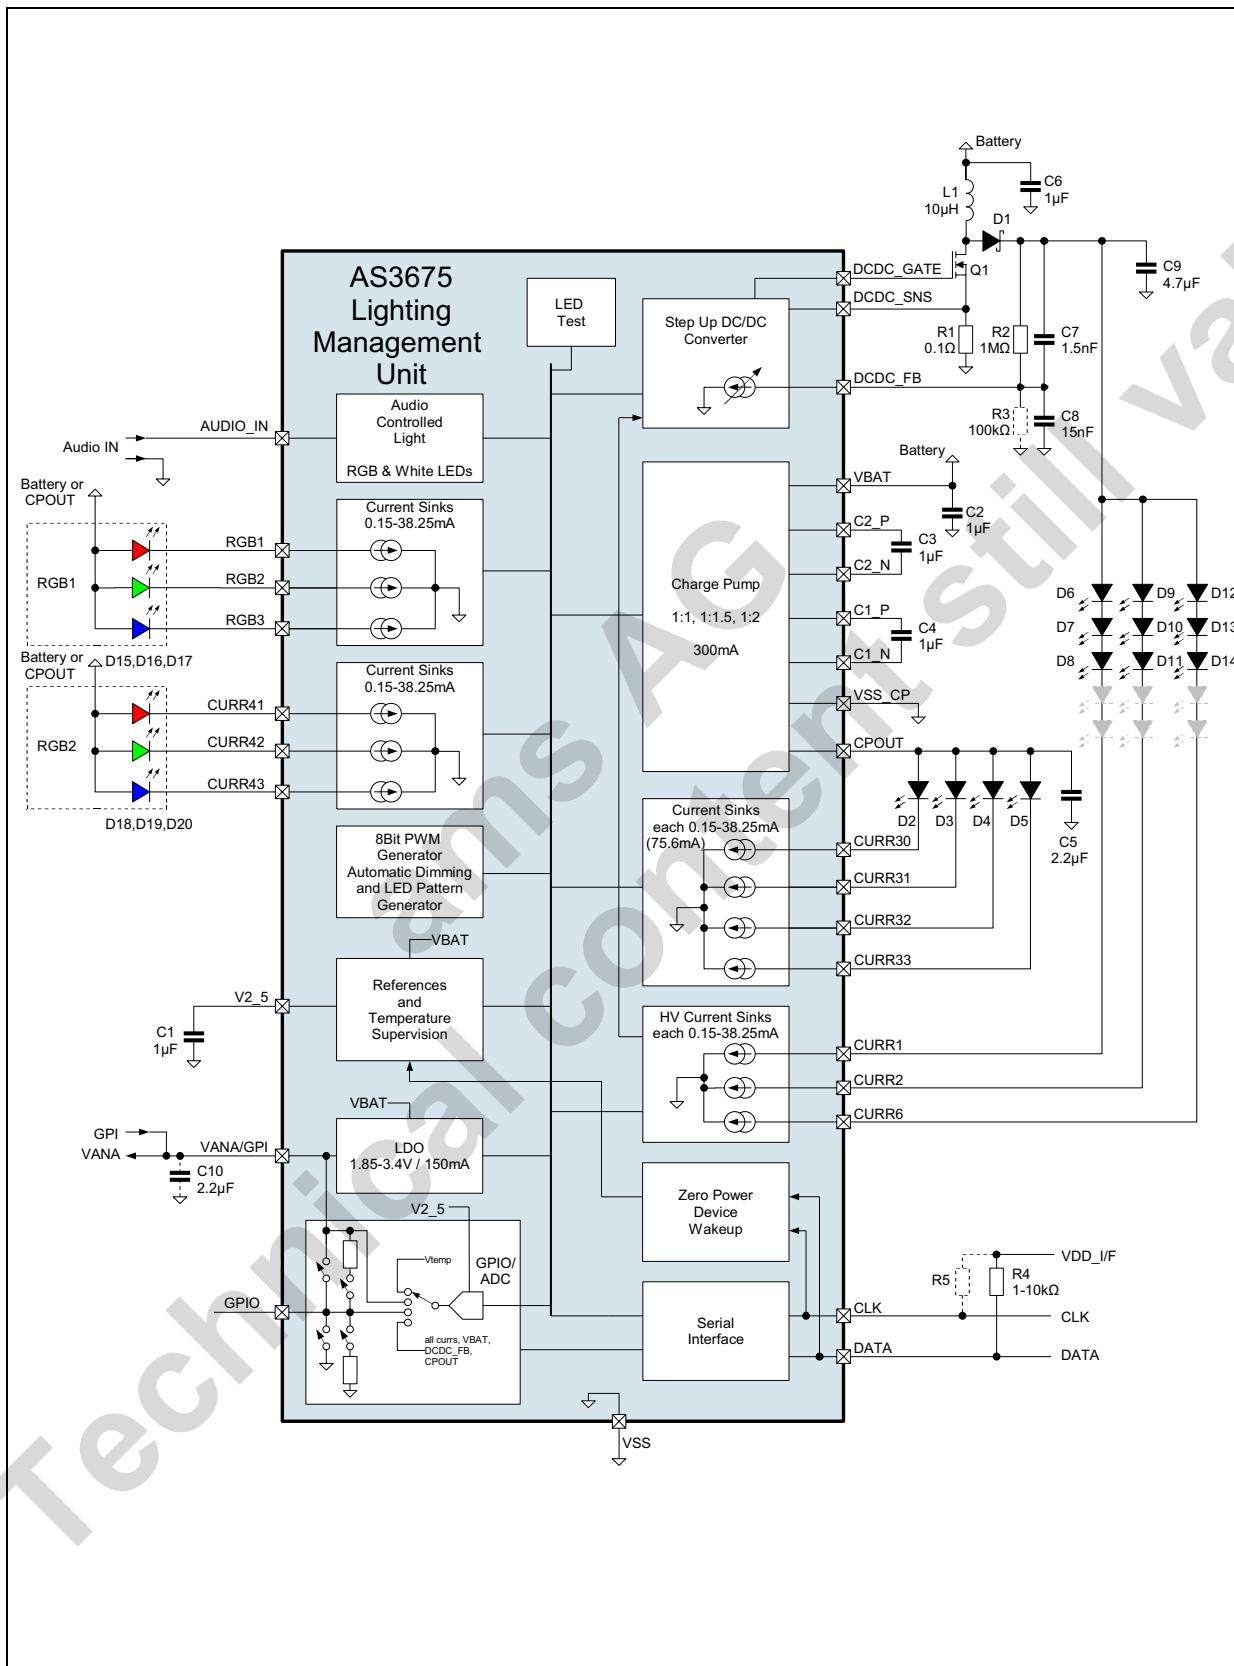

2 Key Features

- High-Efficiency Step Up DC/DC Converter
 - Up to 16V/55mA (or 25V/35mA) for White LEDs
 - Programmable Output Voltage with External Resistors and Serial Interface
 - Over voltage Protection
- High-Efficiency High-Power Charge Pump
 - 1:1, 1:1.5, and 1:2 Mode
 - Automatic Up Switching (can be disabled and 1:2 mode can be blocked)
 - Output Current up to 300mA/500mA pulsed
 - Efficiency up to 95%
 - Very Low effective Resistance (2.5Ω typ. in 1:1.5)
 - Only 4 External Capacitors Required:
 - $2 \times 1\mu F$ Flying Capacitors, $2 \times 2.2\mu F$ Input/Output Capacitors
 - Supports LCD White Backlight LEDs, or RGB LEDs
- 13 Current Sinks
 - All 13 current sinks fully Programmable (8-bit) from: 0.15mA to 38.5mA (up to 75.6mA for CURR30...CURR33)
 - Three current sinks are High Voltage capable (CURR1, CURR2, CURR6)
 - Programmable Hardware Control (Strobe, and Preview or PWM)
 - Selectively Enable/Disable Current Sinks
- Internal PWM Generation
 - 8 Bit resolution
 - Autonomous Logarithmic up/down dimming
- Led Pattern Generator
 - Autonomous driving for Fun RGB LEDs
 - Support indicator LEDs
- 10-bit Successive Approximation ADC
 - $27\mu s$ Conversion Time
 - Selectable Inputs: GPIO, all current sources, VBAT, CPOUT, DCDC_FB
 - Internal Temp. Measurement
 - Light Sensor input
- Support for automatic LED testing (open and shorted LEDs can be identified)
- Support for external Temperature Sensor for high current LED protection (CURR3x)
- Strobe Timeout protection
 - Up to 1600ms
 - Three different timing modes
- Two General Purpose Inputs/Output
 - VANA/GPI Input, GPIO Input/Output
 - Digital Input, Digital Output using VANA/GPI supply and Tristate
 - VANA/GPI internal pull down
 - GPIO Programmable Pull-Up/Down
- Programmable LDO
 - 1.85 to 3.4V, 150mA
 - Programmable via Serial Interface
- Standby LDO always on
 - Regulated 2.5V max. output 10mA
 - $3\mu A$ Quiescent Current
- Audio can be used to drive RGB LED or up to four white LEDs
 - RGB Color and Brightness is dependent on audio input amplitude or frequency
- White LEDs can be controlled by amplitude or frequency (different modes like bar-type or two and two LEDs driven by frequency filters)
- Wide Battery Supply Range: 3.0 to 5.5V
- Two Wire Serial Interface Control
- Over current and Thermal Protection
- WL-CSP30 3x2.5mm, 0.5mm pitch Package

3 Applications

Power- and lighting-management for mobile telephones and other 1-cell Li+ or 3-cell NiMH powered devices.

4 Pinout

Table 1. Pin Description for AS3675

Pin Number	Pin Name	Type	Description
A1	GPIO	AIO	General Purpose Input Output
A2	VANA/GPI	AIO	LDO Output/General Purpose Input
A3	C2_N	AIO	Charge Pump flying capacitor; connect a ceramic capacitor of 500nF to this pin.
A4	C1_P	AIO	Charge Pump flying capacitor; connect a ceramic capacitor of 500nF to this pin.
A5	CPOUT	AO	Output voltage of the Charge Pump; connect a ceramic capacitor of 1µF ($\pm 20\%$).
A6	DATA	DIO	Serial interface data input/output.
B1	AUDIO_IN	AI	Audio Input
B2	VSS_CP	GND	Ground Pad for Charge Pump
B3	C1_N	AIO	Charge Pump flying capacitor; connect a ceramic capacitor of 500nF to this pin.
B4	C2_P	AIO	Charge Pump flying capacitor; connect a ceramic capacitor of 500nF to this pin.
B5	DCDC_GATE	AO	DCDC gate driver.
B6	CLK	DI	Clock input for serial interface.
C1	CURR41	AI	Analog current sink input
C2	RGB3	AI	Analog current sink input
C3	VSS	GND	Ground pad
C4	VBAT	S	Supply pad. Connect to battery.
C5	CURR30	AI	Analog current sink input, intended for activity icon LED
C6	DCDC_SNS	AI	Sense input of shunt resistor for Step Up DC/DC Converter.
D1	CURR43	AI	Analog current sink input
D2	RGB1	AI	Analog current sink input
D3	CURR33	AI	Analog current sink input, intended for activity icon LED
D4	CURR31	AI	Analog current sink input, intended for activity icon LED
D5	CURR2	AI_HV	Analog current sink input (intended for Keyboard backlight)
D6	DCDC_FB	AI	DCDC feedback. Connect to resistor string.
E1	CURR42	AI	Analog current sink input
E2	RGB2	AI	Analog current sink input
E3	CURR32	AI	Analog current sink input, intended for activity icon LED
E4	CURR6	AI_HV	Analog current sink input (intended for Keyboard backlight)
E5	CURR1	AI_HV	Analog current sink input (intended for Keyboard backlight)
E6	V2_5	AO3	Output voltage of the Low-Power LDO; always connect a ceramic capacitor of 1µF ($\pm 20\%$) or 2.2µF ($+100\%/-50\%$). Do not load this pin during device startup.

4.1 Pin Definitions

Table 2. Pin Type Definitions

Type	Description

5 Absolute Maximum Ratings

Stresses beyond those listed in [Table 3](#) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in [Table 4, "Operating Conditions," on page 6](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 3. Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Units	Comments
VIN_HV	15V Pins	-0.3	17	V	Applicable for high-voltage current sink pins CURR1, CURR2, CURR6
VIN_MV	5V Pins	-0.3	7.0	V	Applicable for 5V pins VBAT, CURR30-33, CURR41-43, RGB1-3, C1_N, C2_N, C1_P, C2_P, CPOUT, DCDC_FB, DCDC_GATE, CLK, DATA;
VIN_LV	3.3V Pins	-0.3	5.0	V	Applicable for 3.3V pins V2_5; DCDC_SNS, GPIO, VANA/GPI, AUDIO_IN
	Input Pin Current	-25	+25	mA	At 25°C, Norm: JEDEC 17
Tstrg	Storage Temperature Range	-55	125	°C	
IIN	Humidity	5	85	%	Non-condensing
VESD	Electrostatic Discharge	-2000	2000	V	Norm: MIL 883 E Method 3015
Pt	Total Power Dissipation		0.75	W	TA = 70 °C, Tjunc_max = 125°C
TBODY	Peak Body Temperature		260	°C	T = 20 to 40s, in accordance with IPC/JEDEC J-STD 020.

6 Electrical Characteristics

Table 4. Operating Conditions

Symbol	Parameter	Condition	Min	Typ	Max	Unit
General Operating Conditions						
VHV	High Voltage	Applicable for high-voltage current sink pins CURR1, CURR2 and CURR6.	0.0		15.0	V
VBAT	Battery Voltage	Pin VBAT	3.0	3.6	5.5	V
VPERI	Periphery Supply Voltage	For serial interface pins.	1.5		5.5	V
V2_5	Voltage on Pin V2_5	Internally generated	2.4	2.5	2.6	V
TAMB	Operating Temperature Range		-30	25	85	°C
IACTIVE	Battery current	Normal Operating current (see Operating Modes on page 71)		35		µA
ISTANDBY	Standby Mode Current	Current consumption in standby mode. Only 2.5V regulator on, interface active		8	13	µA
ISHUTDOWN	Shutdown Mode Current	interface inactive (CLKand DATA set to 0V)		0.1	3	µA

8 Detailed Description

8.1 Analog LDO

The LDO is a general purpose LDO and the output pin is shared with the general purpose input (GPI) connected to VANA/GPI. The design is optimized to deliver the best compromise between quiescent current and regulator performance for battery powered devices.

Stability is guaranteed with ceramic output capacitors (of $1\mu\text{F} \pm 20\%$ (X5R) or $2.2\mu\text{F} + 100/-50\%$ (Z5U)). The low ESR of these capacitors ensures low output impedance at high frequencies. The low impedance of the power transistor enables the device to deliver up to 150mA even at nearly discharged batteries without any decrease in performance.

The LDO is off by default after start-up.

Figure 11. Analog LDO Block Diagram

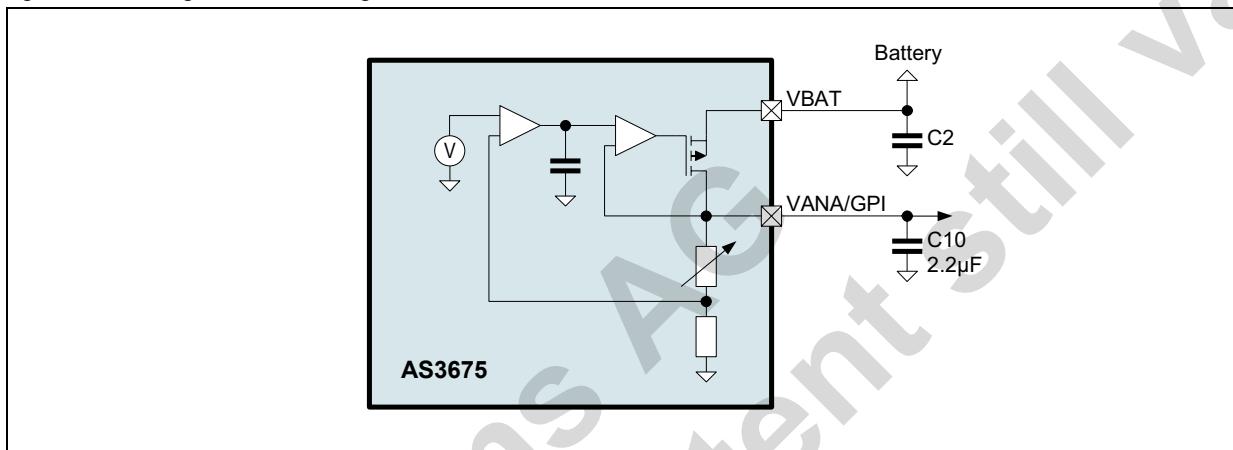

Table 5. Electrical Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
V _{BAT}	Supply Voltage Range		3.0		5.5	V
R _{ON}	On Resistance	@150mA, full operating temperature range			1.0	Ω
V _{DROPOUT}	Dropout Voltage	@150mA, I _{do_ana_lpo} (see page 10)= 0			150	mV
		@50mA, I _{do_ana_lpo} = 0			50	mV
		@5mA, I _{do_ana_lpo} = 1			500	mV
I _{ON}	Supply Current	Without load		50		μA
		Without load, I _{do_ana_lpo} = 1 I _{do_ana} only		3		
		With 150mA load		150		
I _{OFF}	Shutdown Current	Without load			100	nA
t _{start}	Start-up Time				200	μs
V _{out_tol}	Output Voltage Tolerance		-3		+3	%
V _{OUT}	Output Voltage	VBAT > 3.0V and I _{OUT} =150mA	1.8		2.85	V
		Full Programmable Range	1.8		3.35	V
I _{LIMIT} ¹	LDO Current Limit I _{do_ana_lpo} = 0	Pin VANA. LDO acts as current source if the output current exceeds I _{LIMIT} .	300	450 ²		mA
	LDO Current Limit I _{do_ana_lpo} = 1	V _{BAT} -VANA≥0.2V	4	8		mA

1. Not production tested – guaranteed by design and laboratory verification
2. During startup of the LDO the current limit is half the value of I_{LIMIT}

8.1.1 LDO Registers

Table 6. *Reg. control* Register

Addr: 00		Reg. control			
		This register enables/disables the LDOs, Charge Pumps, Charge Pump LEDs, current sinks, the Step Up DC/DC Converter, and low-power mode.			
Bit	Bit Name	Default	Access	Description	
0	ldo_ana_on	0	R/W	0	Analog LDO is switched off
				1	Analog LDO is switched on
7	ldo_ana_lpo	0	R/W	0	Normal Operation
				1	Low-power mode; current consumption is reduced by about 75µA. Reduced performance of LDO: max 5mA load, internal oscillator is switched off. The device will exit low-power mode automatically, if blocks requiring the oscillator are enabled.

Table 7. *LDO ANA1 Voltage* Register

Addr: 07h		LDO ANA1 Voltage			
		This register sets the output voltage (VANA) for the LDO.			
Bit	Bit Name	Default	Access	Description	
4:0	ldo_ana_voltage	00000b	R/W	Controls LDO voltage selection.	
				00000b	1.85V
				...	LSB=50mV
				11111b	3.4V

8.2 Step Up DC/DC Converter

The Step Up DC/DC Converter is a high-efficiency current mode PWM regulator, providing output voltage up to e.g. 25V/35mA or e.g. 16V/55mA. A constant switching-frequency results in a low noise on the supply and output voltages.

Figure 12. Step Up DCDC Converter Block Diagram Option: Current Feedback with Over voltage protection

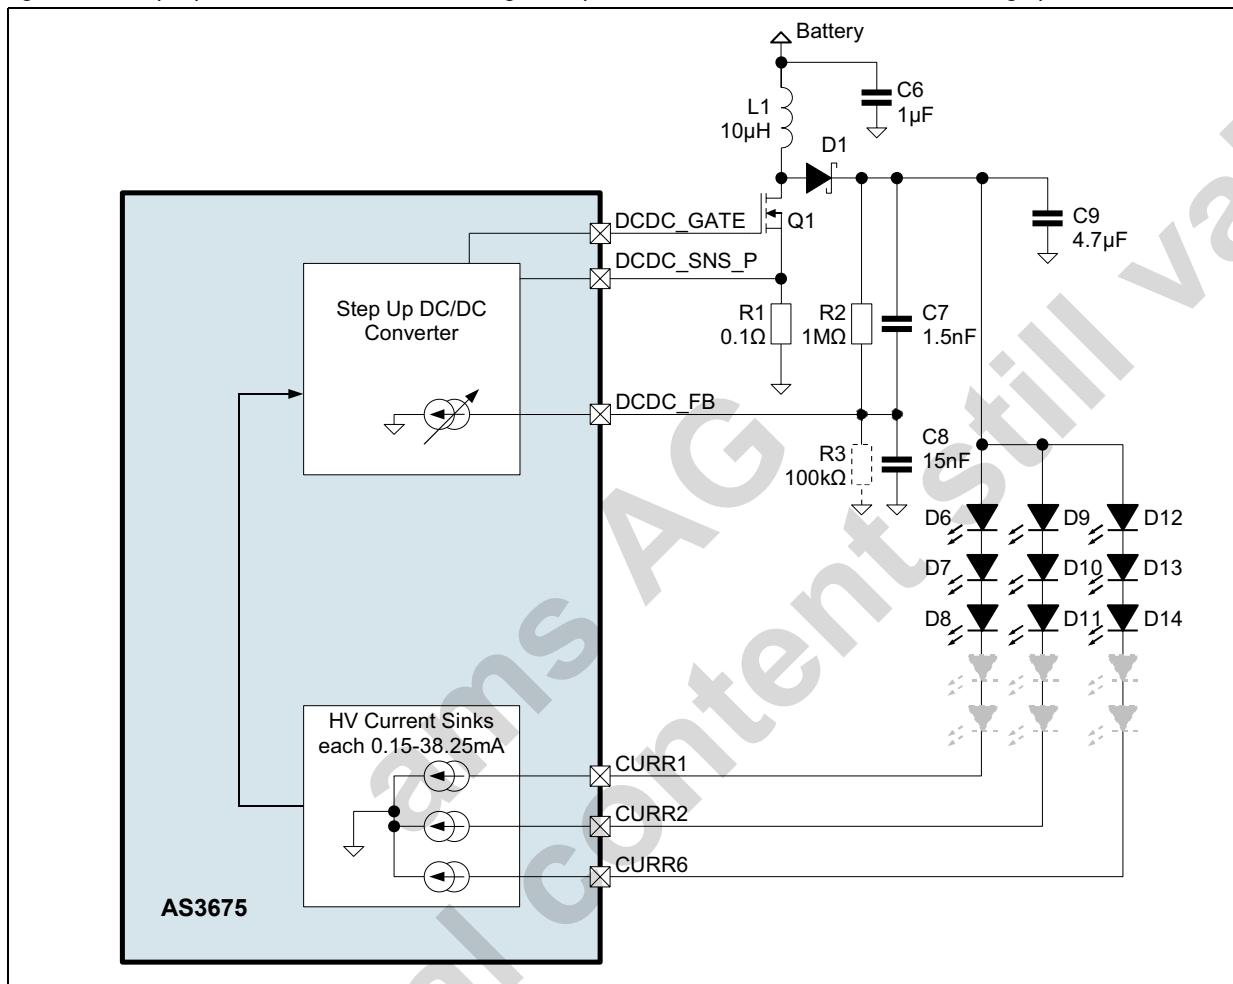

Table 8. Step Up DC/DC Converter Parameters

Symbol	Parameter	Condition	Min	Typ	Max	Unit
IVDD	Quiescent Current	Pulse skipping mode.		140		µA
VFB1	Feedback Voltage for External Resistor Divider	For constant voltage control. <i>step_up_res</i> = 1	1.20	1.25	1.30	V
VFB2	Feedback Voltage for Current Sink Regulation	on CURR1, CURR2 or CURR6 in regulation. <i>step_up_res</i> = 0	0.4	0.5	0.6	V
IDCDC_FB	Additional Tuning Current at Pin DCDC_FB and over voltage protection	Adjustable by software using Register DCDC control1 1µA step size (0-31µA) VPROTECT = 1.25V + IDCDC_FB * R2	0		31	µA
	Accuracy of Feedback Current at full scale		-6		6	%

Table 8. Step Up DC/DC Converter Parameters

Symbol	Parameter	Condition	Min	Typ	Max	Unit
Vrsense_max	Current Limit Voltage at R1	e.g., 0.66A for 0.1Ω sense resistor.	46	66	85	mV
		For fixed startup time of 500us	25	33	43	
		If Step up_lowcur= 1	30	43	57	
Rsw	Switch Resistance	ON-resistance of external switching transistor.			1	Ω
ILOAD	Load Current	At 16V output voltage	0		55	mA
		At 25V output voltage	0		35	
fIN	Switching Frequency	Internally trimmed	0.9	1	1.1	MHz
COUT	Output Capacitor	Ceramic, ±20%. Use nominal 4.7µF capacitors to obtain at least 0.7µF under all conditions (voltage dependence of capacitors)	0.7	4.7		µF
L	Inductor	Use inductors with small Cparasitic (<100pF) to get high efficiency.	7	10	13	µH
tMIN_ON	Minimum on Time		90	140	190	ns
MDC	Maximum Duty Cycle		88	91		%
Vripple	Voltage ripple >20kHz	Cout=4.7µF, Iout=0..45mA, VBAT=3.0...4.2V			160	mV
	Voltage ripple <20kHz				40	mV
Efficiency	Efficiency	Iout=20mA, Vout=17V, VBAT=3.8V		85		%

To ensure soft startup of the dc/dc converter, the over current limits are reduced for a fixed time after enabling the dc/dc converter. The total startup time for an output voltage of e.g. 25V is less than 2ms.

8.2.1 Feedback Selection

Register **DCDC control1** and **DCDC control2** selects the type of feedback for the Step Up DC/DC Converter.

The feedback for the DC/DC converter can be selected either by current sinks (CURR1, CURR2, CURR6) or by a voltage feedback at pin DCDC_FB. If the register bit **step_up_fb_auto** is set, the feedback path is automatically selected between CURR1, CURR2 and CURR6 (the lowest voltage of these current sinks is used).

Setting **step_up_fb** enables feedback on the pins CURR1, CURR2 or CURR6. The Step Up DC/DC Converter is regulated such that the required current at the feedback path can be supported. (Bit **step_up_res** should be set to 0 in this configuration)

Note: Always choose the path with the highest voltage drop as feedback to guarantee adequate supply for the other (unregulated) paths or enable the register bit **step_up_fb_auto**.

8.2.2 Over voltage Protection in Current Feedback Mode

The over voltage protection in current feedback mode (**step_up_fb** = 01, 10 or 11 or **step_up_fb_auto** = 1) works as follows: Only resistor R2 and C7/C8 is soldered and R3 is omitted. An internal current source (sink) is used to generate a voltage drop across the resistor R2. If then the voltage on DCDC_FB is above 1.25V, the DCDC is momentarily disabled to avoid too high voltages on the output of the DCDC converter.

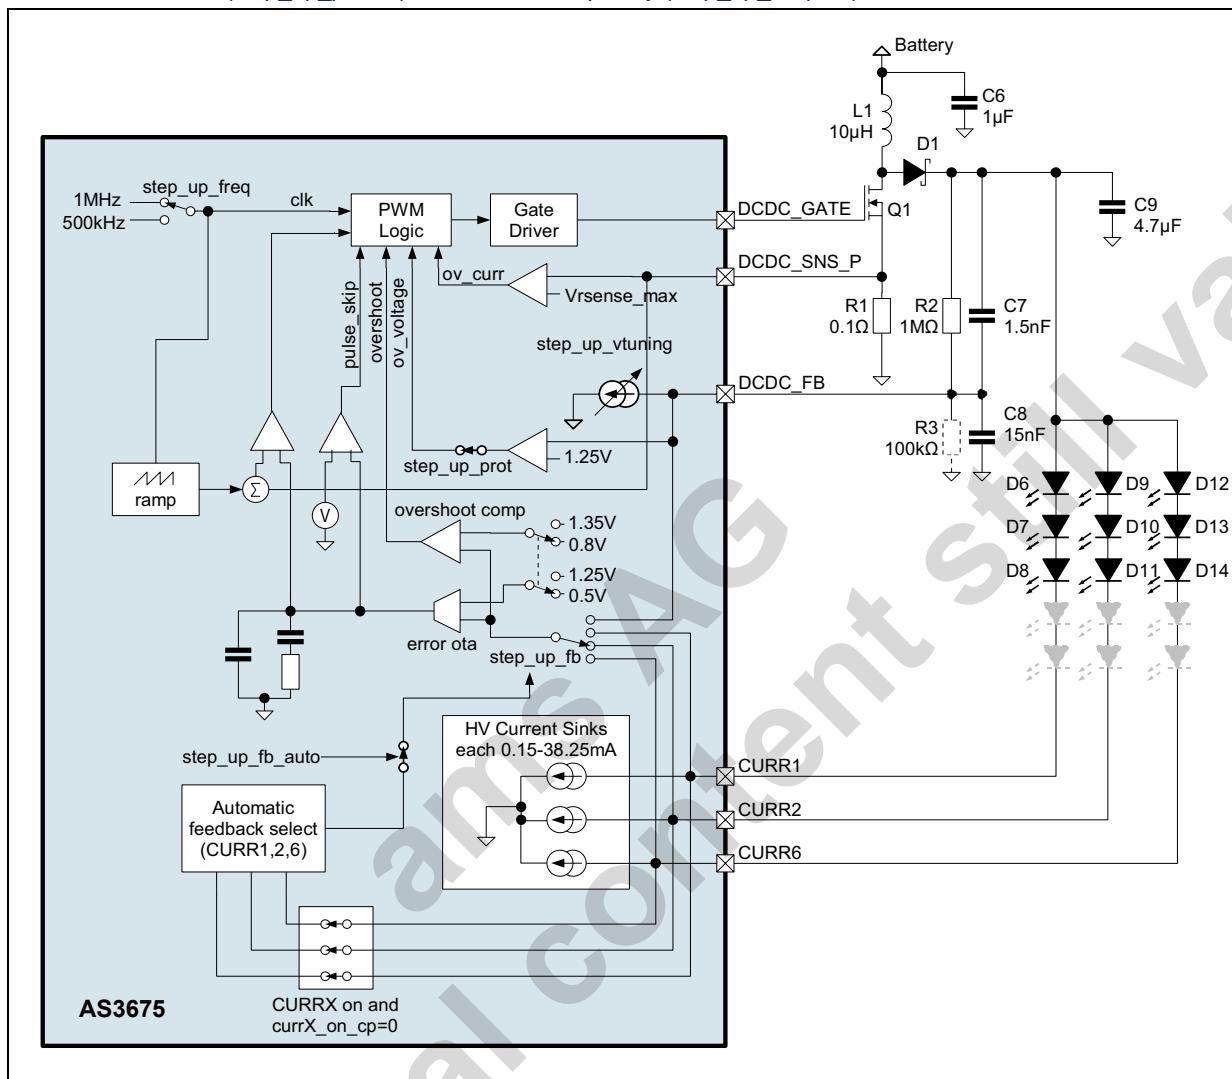

The protection voltage can be calculated according to the following formula:

$$V_{PROTECT} = 1.25V + IDCDC_FB * R2 \quad (EQ\ 1)$$

Note: The voltage on the pin DCDC_FB is limited by an internal protection diode to VBAT + one diode forward voltage (typ. 0.6V).

If the over voltage protection is not used in current feedback mode, connect DCDC_FB to ground.

Figure 13. Step Up DC/DC Converter Detail Diagram; Option: Regulated Output Current, Feedback is automatically selected between CURR1, CURR2, CURR6 (step_up_fb_auto=1); over voltage protection is enabled (step_up_prot=1); 1MHz clock frequency (step_up_freq=0)

8.2.3 Voltage Feedback

Setting bit `step_up_fb` (see page 15) = 00 enables voltage feedback at pin `DCDC_FB`.

The output voltage is regulated to a constant value, given by (Bit `step_up_res` should be set to 1 in this configuration)

$$U_{Step\ up\ out} = (R_2 + R_3)/R_3 * 1.25 + I_{DCDC_FB} * R_2 \quad (EQ\ 2)$$

If R_4 is not used, the output voltage is by (Bit `step_up_res` should be set to 0 in this configuration)

$$U_{Step\ up\ out} = 1.25 + I_{DCDC_FB} * R_2 \quad (EQ\ 3)$$

Where:

$U_{Step\ up\ out}$ = Step Up DC/DC Converter output voltage

R_2 = Feedback resistor R_2

R_3 = Feedback resistor R_3

I_{DCDC_FB} = Tuning current at ball DCDC_FB; 0 to 31 μ A

Table 9. Voltage Feedback Example Values

I_{DCDC_FB}	$U_{Step\ up_out}$	$U_{Step\ up_out}$
μ A	$R2 = 1M\Omega$, $R3$ not used	$R2 = 500k\Omega$, $R3 = 50k\Omega$
0	-	13.75
1	-	14.25
2	-	14.75
3	-	15.25
4	-	15.75
5	6.25	16.25
6	7.25	16.75
7	8.25	17.25
8	9.25	17.75
9	10.25	18.25
10	11.25	18.75
11	12.25	19.25
12	13.25	19.75
13	14.25	20.25
14	15.25	20.75
15	16.25	21.25
...
30	31.25	28.75
31	32.25	29.25

Note: The voltage on CURR1, CURR2 and CURR6 must not exceed 15V (see page 25)

8.2.4 PCB Layout Hints

To ensure good EMC performance of the DCDC converter, keep its external power components C6, R1, L1, Q1, D1 and C9 close together. Connect the ground of C6, R1 and C9 locally together and connect this with a short path to AS3675 VSS. This ensures that local high-frequency currents will not flow to the battery.

8.2.5 Step up Registers

Table 10. Reg. control Register

Addr: 00		Reg. control			
		This register enables/disables the Charge Pump and the Step Up DC/DC Converter.			
Bit	Bit Name	Default	Access	Description	
3	step_up_on	0	R/W	Enable the step up converter	
				0b	Disable the Step Up DC/DC Converter
				1b	Enable the Step Up DC/DC Converter

Table 11. DCDC control1 Register

Addr: 21h		DCDC control1			
		This register controls the Step Up DC/DC Converter.			
Bit	Bit Name	Default	Access	Description	
0	step_up_frequ	0	R/W	Defines the clock frequency of the Step Up DC/DC Converter.	
				0	1MHz
				1	500kHz
2:1	step_up_fb	00	R/W	Controls the feedback source if step_up_fb_auto = 0	
				00	DCDC_FB enabled (external resistor divider). Set step_up_fb=00 (DCDC_FB)
				01	CURR1 feedback enabled (feedback via LEDs)
				10	CURR2 feedback enabled (feedback via LEDs)
				11	CURR6 feedback enabled (feedback via LEDs)
7:3	step_up_vtuning	00000	R/W	Defines the tuning current at pin DCDC_FB.	
				00000	0 µA
				00001	1 µA
				00010	2 µA
				
				10000	15 µA
				
				11111	31 µA

Table 12. DCDC control2 Register

Addr: 22h		DCDC control2			
		This register controls the Step Up DC/DC Converter and low-voltage current sinks CURR3x.			
Bit	Bit Name	Default	Access	Description	
0	step_up_res	0	R/W	Gain selection for Step Up DC/DC Converter	
				0	Select 0 if Step Up DC/DC Converter is used with current feedback (CURR1, CURR2, CURR6) or if DCDC_FB is used with current feedback only – R2, C7, C8 connected, R3 not used
				1	Select 1 if DCDC_FB is used with external resistor divider using 2 resistors: R2 and R3
1	skip_fast	0	R/W	Step Up DC/DC Converter output voltage at low loads, when pulse skipping is active	
				0	Accurate output voltage, more ripple
				1	Elevated output voltage, less ripple
2	step_up_prot	1	R/W	Step Up DC/DC Converter protection	
				0	No over voltage protection
				1	Over voltage protection on pin DCDC_FB enabled voltage limitation =1.25V on DCDC_FB

Table 12. DCDC control2 Register

Addr: 22h		DCDC control2		
This register controls the Step Up DC/DC Converter and low-voltage current sinks CURR3x.				
Bit	Bit Name	Default	Access	Description
3	Step up_lowcur	1	R/W	Step Up DC/DC Converter coil current limit
				0 Normal current limit
				1 Current limit reduced by approx. 33%
7	step_up_fb_auto	0	R/W	0 step_up_fb select the feedback of the DCDC converter
				1 The feedback is automatically chosen within the current sinks CURR1, CURR2 and CURR6 (never DCDC_FB). Only those are used for this selection, which are enabled (currX_mode must not be 00) and not connected to the charge pump (currX_on_cp must be 0).

8.3 Charge Pump

The Charge Pump uses two external flying capacitors C3, C4 to generate output voltages higher than the battery voltage. There are three different operating modes of the charge pump itself:

- 1:1 Bypass Mode
 - Battery input and output are connected by a low-impedance switch
 - battery current = output current.
- 1:1.5 Mode
 - The output voltage is up to 1.5 times the battery voltage (without load), but is limited to VCPOUTmax all the time
 - battery current = 1.5 times output current.
- 1:2 Mode
 - The output voltage is up to 2 times the battery voltage (without load), but is limited to VCPOUTmax all the time
 - battery current = 2 times output current

As the battery voltage decreases, the Charge Pump must be switched from 1:1 mode to 1:1.5 mode and eventually in 1:2 mode in order to provide enough supply for the current sinks. Depending on the actual current the mode with best overall efficiency can be automatically or manually selected:

Examples:

- Battery voltage = 3.7V, LED dropout voltage = 3.5V. The 1:1 mode will be selected and there is 200mV drop on the current sink and on the Charge Pump switch. Efficiency 95%.
- Battery voltage = 3.5V, LED dropout voltage = 3.5V. The 1:1.5 mode will be selected and there is 1.5V drop on the current sink and 250mV on the Charge Pump. Efficiency 66%.
- Battery voltage = 3.8V, LED dropout voltage = 4.5V (Camera Flash). The 1:2 mode can be selected and there is 600mV drop on the current sink and 2.5V on the Charge Pump. Efficiency 60%.

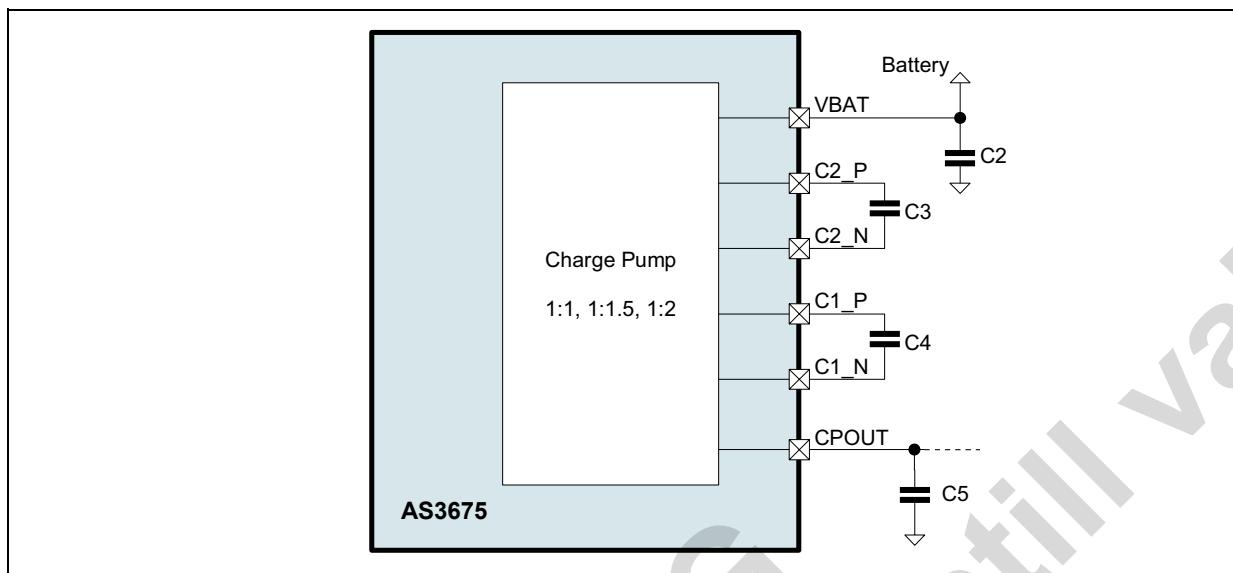

The efficiency is dependent on the LED forward voltage given by:

$$Eff = (V_{LED} * I_{out}) / (U_{in} * I_{in}) \quad (EQ\ 4)$$

The charge pump mode switching can be done manually or automatically with the following possible software settings:

- Automatic up all modes allowed (1:1, 1:1.5, 1:2)
 - Start with 1:1 mode
 - Switch up automatically 1:1 to 1:1.5 to 1:2
- Automatic up, but only 1:1 and 1:1.5 allowed
 - Start with 1:1 mode
 - Switch up automatically only from 1:1 to 1:1.5 mode; 1:2 mode is not used
- Manual
 - Set modes 1:1, 1:1.5, 1:2 by software

Figure 14. Charge Pump Pin Connections

The Charge Pump requires the external components listed in the following table:

Table 13. Charge Pump External Components

Symbol	Parameter	Condition	Min	Typ	Max	Unit
C ₂	External Decoupling Capacitor	Ceramic low-ESR capacitor between pins VBAT and VSS.		1.0		μF
C ₃ , C ₄	External Flying Capacitor (2x)	Ceramic low-ESR capacitor between pins C _{1_P} and C _{1_N} , between pins C _{2_P} and C _{2_N} and between VBAT and VSS		1.0		μF
C ₅	External Storage Capacitor	Ceramic low-ESR capacitor between pins CPOUT and VSS, pins CPOUT and VSS. Use nominal 2.2μF capacitors (size 0603)		2.2		μF

Note: The connections of the external capacitors C₂, C₃, C₄ and C₅ should be kept as short as possible.

The maximum voltage on the flying capacitors C₃ and C₄ is VBAT.

Table 14. Charge Pump Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
ICPOUT	Output Current Continuous	Depending on PCB layout	0.0		300	mA
	Output Current Pulsed	max. 200ms V _{CPOUT} = VBAT * CPmode - I _{LOAD} * R _{CP}	0.0		500	mA
V _{CPOUTmax}	Output Voltage	Internally limited, Including output ripple			5.6	V
η	Efficiency	Including current sink loss; ICPOUT < 100mA.	60		90	%
ICP1_1.5	Power Consumption without Load fclk = 1 MHz	1:1.5 Mode		3.4		mA
ICP1_2		1:2 Mode		3.8		
Rcp1_1	Effective Charge Pump Output Resistance (Open Loop, fclk = 1MHz)	1:1 Mode; VBAT ≥ 3.5V		0.57		Ω
Rcp1_1.5		1:1.5 Mode; VBAT ≥ 3.3V		2.65		
Rcp1_2		1:1.2 Mode; VBAT ≥ 3.1V		3.25		
fclk Accuracy	Accuracy of Clock Frequency		-10		10	%

Table 14. Charge Pump Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
currhv_switch	CURR1, 2, 6 minimum voltage				0.45	V
curriv_switch	CURR30-33, RGB1-3, CURR41-3 minimum voltage	If the voltage drops below this threshold, the charge pump will use the next available mode (1:1 -> 1:1.5 or 1:1.5 -> 1:2)			0.2	V
	CURR30-33 0-75.6mA range for strobe if curr3x_strobe_high=1				0.4	V
tdeb	CP automatic up-switching debounce time	cp_start_debounce=0		240		μsec
		After switching on CP (cp_on set to 1), if cp_start_debounce=1		2000		μsec

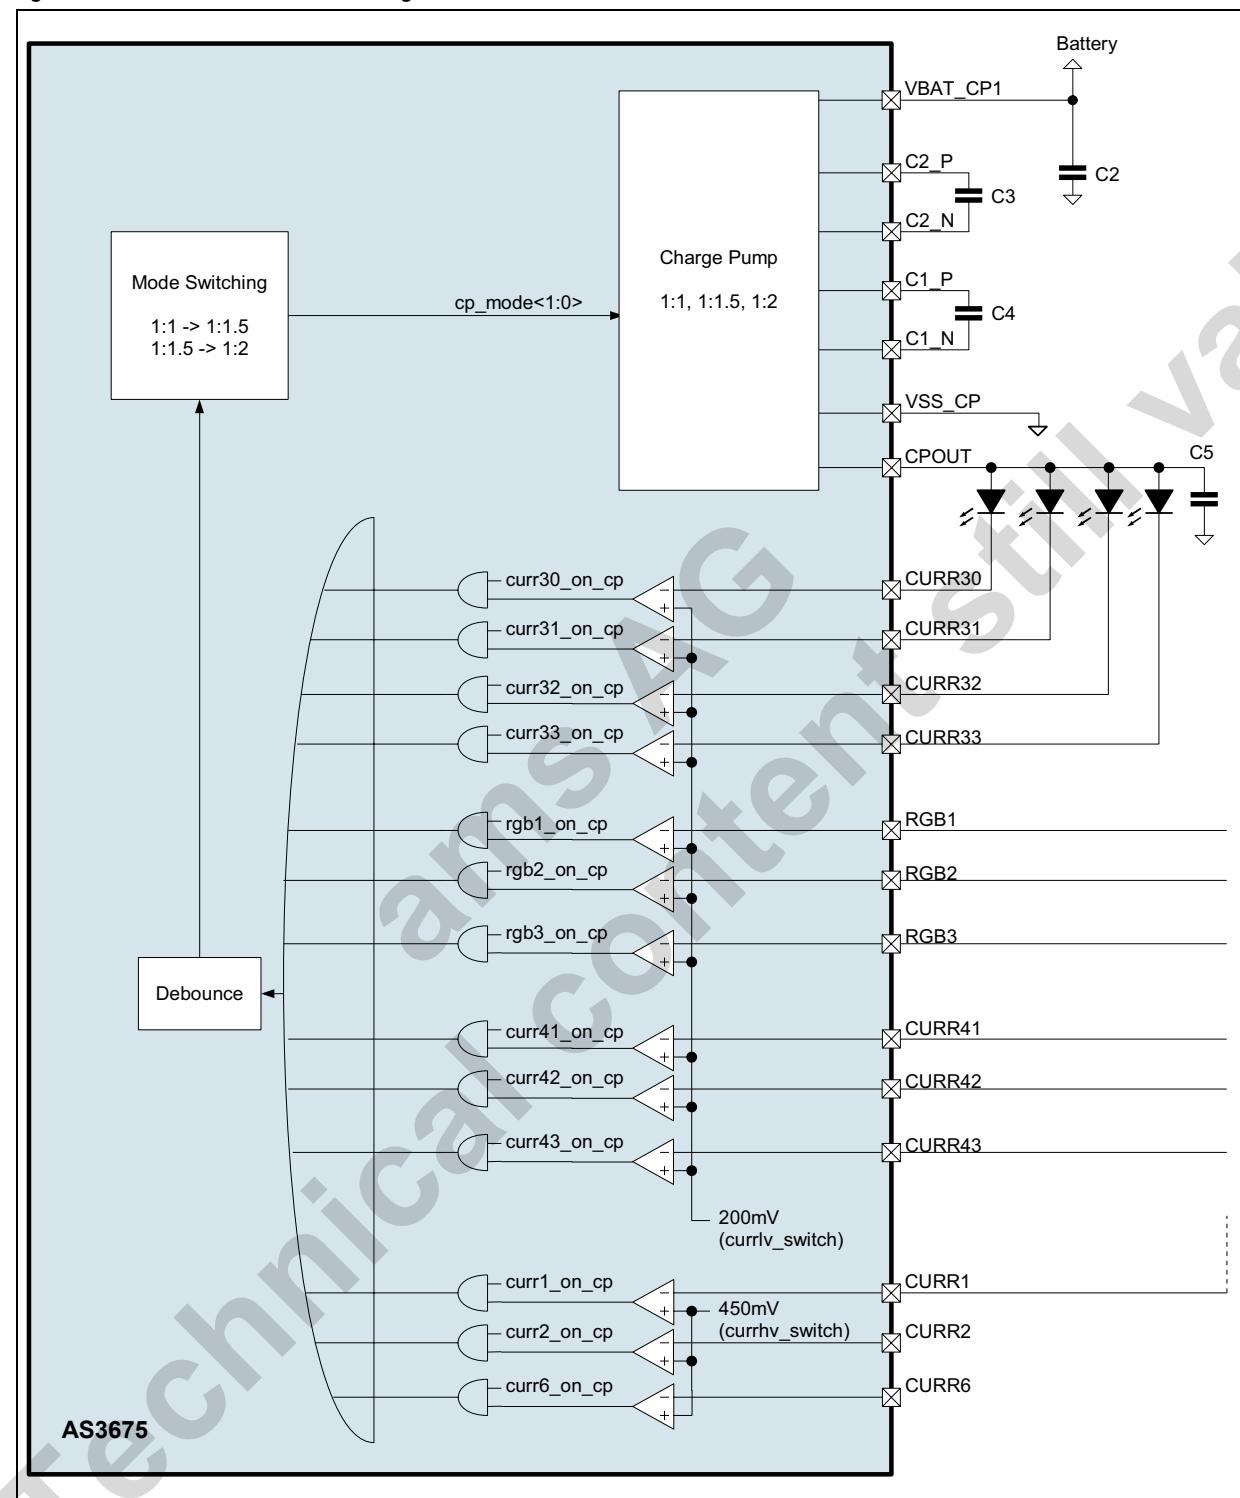

8.3.1 Charge Pump Mode Switching

If automatic mode switching is enabled (`cp_mode_switching` (see page 20) = 00 or `cp_mode_switching` = 01) the charge pump monitors the current sinks, which are connected via a led to the output CPOUT. To identify these current sources (sinks), the registers `CP mode Switch1` and `CP mode Switch2` (register bits `curr30_on_cp` (see page 21) ... `curr33_on_cp`, `rgb1_on_cp` ... `rgb3_on_cp`, `curr1_on_cp`, `curr2_on_cp`, `curr41_on_cp` ... `curr43_on_cp` and `curr6_on_cp`) should be setup before starting the charge pump (`cp_on` (see page 20) = 1). If any of the voltage on these current sources drops below the threshold (`curriv_switch`, `currhv_switch`), the next higher mode is selected after the debounce time.

To avoid switching into 1:2 mode (battery current = 2 times output current), set `cp_mode_switching` = 01.

If the `currX_on_cp`=0 and the according current sink is connected to the charge pump, the current sink will be functional, but there is no up switching of the charge pump, if the voltage compliance is too low for the current sink to supply the specified current.

Figure 15. Automatic Mode Switching

8.3.2 Soft Start

An implemented soft start mechanism reduces the inrush current. Battery current is smoothed when switching the charge pump on and also at each switching condition. This precaution reduces electromagnetic radiation significantly.

8.3.3 Charge Pump Registers

Table 15. *Reg. control* Register

Addr: 00h		Reg. control			
		This register controls the Charge Pump.			
Bit	Bit Name	Default	Access	Description	
2	cp_on	0	R/W	0	Set Charge Pump into 1:1 mode (off state) unless cp_auto_on is set
				1	Enable manual or automatic mode switching

Table 16. *CP control* Register

Addr: 23h		CP control			
		This register enables/disables the Charge Pump and the Step Up DC/DC Converter.			
Bit	Bit Name	Default	Access	Description	
0	cp_clk	0	R/W	Clock frequency selection.	
				0	1 MHz
				1	500 kHz
2:1	cp_mode	00b	R/W	Charge Pump mode (in manual mode sets this mode, in automatic mode reports the actual mode used) ¹	
				00	1:1 mode
				01	1:1.5 mode
				10	1:2 mode
				11	NA
				Set the mode switching algorithm	
4:3	cp_mode_switching	00b	R/W	00	Automatic Mode switching; 1:1, 1:1.5 and 1:2 allowed
				01	Automatic Mode switching; only 1:1 and 1:1.5 allowed
				10	Manual Mode switching; register cp_mode defines the actual charge pump mode used
				11	Reserved
				0	Mode switching debounce timer is always 240µs
5	cp_start_debounce	0	R/W	1	Upon startup (cp_on set to 1) the mode switching debounce time is first started with 2ms then reduced to 240µs
6	cp_auto_on	0	R/W	0	Charge Pump is switched on/off with cp_on
				1	Charge Pump is automatically switched on if a current sink, which is connected to the charge pump (defined by registers CP Mode Switch 1 & 2) is switched on

1. Direct switching from 1:1.5 mode into 1:2 in manual mode and vice versa is not allowed. Always switch over 1:1 mode.

Table 17. CP mode Switch1 Register

Addr: 24h		CP mode Switch1			
		Setup which current sinks are connected (via leds) to the charge pump; if set to '1' the correspond current source (sink) is used for automatic mode selection of the charge pump			
Bit	Bit Name	Default	Access	Description	
0	curr30_on_cp	0	R/W	0	current Sink CURR30 is not connected to charge pump
				1	current sink CURR30 is connected to charge pump
1	curr31_on_cp	0	R/W	0	current Sink CURR31 is not connected to charge pump
				1	current sink CURR31 is connected to charge pump
2	curr32_on_cp	0	R/W	0	current Sink CURR32 is not connected to charge pump
				1	current sink CURR32 is connected to charge pump
3	curr33_on_cp	0	R/W	0	current Sink CURR33 is not connected to charge pump
				1	current sink CURR33 is connected to charge pump
4	rgb1_on_cp	0	R/W	0	current Sink RGB1 is not connected to charge pump
				1	current sink RGB1 is connected to charge pump
5	rgb2_on_cp	0	R/W	0	current Sink RGB2 is not connected to charge pump
				1	current sink RGB2 is connected to charge pump
6	rgb3_on_cp	0	R/W	0	current Sink RGB3 is not connected to charge pump
				1	current sink RGB3 is connected to charge pump

Table 18. CP mode Switch2 Register

Addr: 25h		CP mode Switch2			
		Setup which current sinks are connected (via LEDs) to the charge pump; if set to '1' the correspond current source (sink) is used for automatic mode selection of the charge pump			
Bit	Bit Name	Default	Access	Description	
0	curr1_on_cp	0	R/W	0	current Sink CURR1 is not connected to charge pump
				1	current sink CURR1 is connected to charge pump

Technical Content Standard

8.4 Current Sinks

The AS3675 contains general purpose current sinks intended to control RGB LEDs, white LEDs (e.g. backlights) and can also be used for buzzers or vibrators. All current sinks have an integrated over voltage protection.

CURR1, CURR2 and CURR6 are also used as feedback for the Step Up DC/DC Converter (regulated to 0.5V in this configuration) see [Feedback Selection on page 12](#).

- Current sinks CURR1, CURR2 and CURR6 are high-voltage compliant (15V) current sinks, used e.g., for series of white LEDs
- Current sinks CURR3x (CURR30, CURR31, CURR32 and CURR33) are parallel 5V current sinks, used for backlighting, indicator LEDs or RGB LEDs.
- Current sinks RGB1, RGB2, and RGB3 are general purpose current sinks e.g. for a fun LED.
- Current sinks CURR4x (CURR41, CURR42, and CURR43) are general purpose current sinks.

Table 21. Current Sink Function Overview

Current Sink	Max. Voltage (V)	Max. Current (mA)	Resolution		Software Current Control	Hardware On/Off Control	Can be assigned to Audio Controlled LED Channel
			(Bits)	(mA)			
CURR1	15.0	38.25	8	0.15	Separate	LED Pattern; Internal PWM	ch1
CURR2							ch2
CURR6							ch3
CURR30	VBAT (5.5V)	38.25 (75.6mA for strobe if curr3x_strobe_high=1)	8	0.15	Combined in Strobe/ Preview or Separated	Flash LED Strobe (CURR1 or CURR30) & Preview (CURR2); Internal PWM; LED Pattern	Completely individual assignment of the audio channels ch1, ch2 and ch3 to the outputs
CURR31							
CURR32							
CURR33							
RGB1		38.25	8	0.15	Separate	LED Pattern; Internal PWM	ch1
RGB2							ch2
RGB3							ch3
CURR41		38.25	8	0.15	Separate	LED Pattern; Internal PWM	ch1
CURR42							ch2
CURR43							ch3

8.4.1 High Voltage Current Sinks CURR1, CURR2, CURR6

The high voltage current sinks have a resolution of 8 bits. Additionally an internal protection circuit monitors with a voltage divider (max 3 μ A @ 15V) the voltage on CURR1, CURR2 and CURR6 and increases the current in off state in case of over voltage.

Table 22. HV Current Sinks Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
I _{BIT7}	Current sink if Bit7 = 1	For V(CURRx) > 0.45V		19.2		mA
I _{BIT6}	Current sink if Bit6 = 1			9.6		
I _{BIT5}	Current sink if Bit5 = 1			4.8		
I _{BIT4}	Current sink if Bit4 = 1			2.4		
I _{BIT3}	Current sink if Bit3 = 1			1.2		
I _{BIT2}	Current sink if Bit2 = 1			0.6		
I _{BIT1}	Current sink if Bit1 = 1			0.3		
I _{BIT0}	Current sink if Bit0 = 1			0.15		
Δm	matching Accuracy	CURR1,CURR2,CURR6	-10		+10	%
Δ	absolute Accuracy		-15		+15	%
V _{CURR1,2,6x}	Voltage compliance		0.45		15	V
Ov_prot_13V	Over voltage Protection of current sink CURR1,2,6	At 13V, independent of curr1_prot_on, curr2_prot_on or curr6_prot_on			3.0	μ A
Ov_prot_15V	Over voltage Protection of current sink CURR1,2,6	At 15V, step_up_on=1, curr1_prot_on=1 for CURR1, curr2_prot_on=1 for CURR2, curr6_prot_on=1 for CURR6	0.8		4.0	mA

High Voltage Current Sinks CURR1, CURR2, CURR6 Registers

Table 23. Curr1 current Register

Addr: 09h		Curr1 current			
		This register controls the High voltage current sink current.			
Bit	Bit Name	Default	Access	Description	
7:0	curr1_current	0	R/W	Defines current into current sink curr1	
				00h	0 mA
				01h	0.15 mA
			
				FFh	38.25 mA

Table 24. Curr2 current Register

Addr: 0Ah		Curr2 current			
		This register controls the High voltage current sink current.			
Bit	Bit Name	Default	Access	Description	
7:0	curr2_current	0	R/W	Defines current into current sink curr2	
				00h	0 mA
				01h	0.15 mA
			
				FFh	38.25 mA

Table 25. curr6 current Register

Addr: 2Fh		curr6 current			
		This register controls the High voltage current sink current.			
Bit	Bit Name	Default	Access	Description	
7:0	curr6_current	0	R/W	Defines current into current sink CURR6	
				00h	0 mA
				01h	0.15 mA
			
				FFh	38.25 mA

Table 26. curr12 control Register

Addr: 01h		curr12 control			
		This register select the mode of the current sinks controls High voltage current sink current.			
Bit	Bit Name	Default	Access	Description	
1:0	curr1_mode	0	R/W	Select the mode of the current sink curr1	
				00b	off
				01b	on
				10b	PWM controlled
				11b	LED pattern controlled
				Select the mode of the current sink curr2	
3:2	curr2_mode	0	R/W	00b	off
				01b	on
				10b	PWM controlled
				11b	LED pattern controlled

Table 27. curr rgb control Register

Addr: 02h		curr rgb control			
		This register select the mode of the current sinks CURR6.			
Bit	Bit Name	Default	Access	Description	
7:6	curr6_mode	0	R/W	Select the mode of the current sink CURR6	
				00b	off
				01b	on
				10b	PWM controlled
				11b	LED pattern controlled

Table 28. DCDC control2 Register

Addr: 22h		DCDC control2			
		This register controls the Step Up DC/DC Converter and low-voltage current sinks CURR3x.			
Bit	Bit Name	Default	Access	Description	
4	curr1_prot_on	0	R/W	0	No over voltage protection
				1	Pull down current on CURR1 switched on, if voltage on CURR1 exceeds 13.75V, and step_up_on=1
5	curr2_prot_on	0	R/W	0	No over voltage protection
				1	Pull down current on CURR2 switched on, if voltage exceeds on CURR2 13.75V, and step_up_on=1
6	curr6_prot_on	0	R/W	0	No over voltage protection
				1	Pull down current on CURR6 switched on, if voltage on CURR6 exceeds 13.75V, and step_up_on=1

8.4.2 Current Sinks CURR30, CURR31, CURR32, CURR33

These current sinks have a resolution of 8 bits and can sink up to 38.25mA. The current values can be controlled individually with [curr30_current – curr33_current](#) or common with [curr3x_strobe](#) or [curr3x_preview](#).

Table 29. Current Sinks CURR30,31,32,33 Parameters

Symbol	Parameter	Condition	Min	Typ	Max	Unit
I _{BIT7}	Current sink if Bit7 = 1	For V(CURR3x) > 0.2V		19.2		mA
I _{BIT6}	Current sink if Bit6 = 1			9.6		
I _{BIT5}	Current sink if Bit5 = 1			4.8		
I _{BIT4}	Current sink if Bit4 = 1			2.4		
I _{BIT3}	Current sink if Bit3 = 1			1.2		
I _{BIT2}	Current sink if Bit2 = 1			0.6		
I _{BIT1}	Current sink if Bit1 = 1			0.3		
I _{BIT0}	Current sink if Bit0 = 1			0.15		
Δm	matching Accuracy	CURR30-33	-10		+10	%
Δ	absolute Accuracy		-15		+15	%
V _{CURR3X}	Voltage compliance		0.2		CPO UT	V
		curr3x_strobe_high=1 and strobe function	0.4			

Current Sinks CURR3x Registers

Table 30. Curr3 control2 Register

Addr: 12h		Curr3 control2			
		This register selects the modes of the current sinks30..33 current.			
Bit	Bit Name	Default	Access	Description	
0	preview_off_after_strobe	0b	R/W	Select the switch off mode after strobe pulse	
				0	normal preview/strobe mode
				1	switch off preview after strobe duration has expired. To reinitiate the torch mode the preview_ctrl has to be set off and on again
2:1	preview_ctrl	00b	R/W	Preview is triggered by	
				00b	off
				01b	software trigger (setting this bit automatically triggers preview)
				10b	CURR2 active high; set gpi_curr2_en=1
				11b	CURR2 active low; set gpi_curr2_en=1
5	curr3x_strobe_high	0b	R/W	Double current on CURR30...CURR33 during strobe function	
				0	normal strobe current (0-37.8mA)
				1	double strobe current (0-75.6mA)
7	strobe_pin	0	R/W	Select strobe input pin and current sink outputs (only if strobe_ctrl=10 or 11)	
				0	CURR1 is strobe input; CURR30...CURR33 flash output; set gpi_curr1_en=1
				1	CURR30 is strobe input; CURR1, CURR2, CURR6 flash output; set gpi_curr30_en=1

Table 31. Curr3 strobe control Register

Addr: 11h		Curr3 strobe control			
		This register selects the modes of the current sinks30..33 current.			
Bit	Bit Name	Default	Access	Description	
1:0	strobe_ctrl	00b	R/W	Strobe is triggered by	
				00b	off
				01b	software trigger (setting this bit automatically triggers strobe)
				10b	CURR1 (or CURR30 see strobe_pin) active high
				11b	CURR1 (or CURR30 see strobe_pin) active low
3:2	strobe_mode	00b	R/W	Selects strobe mode	
				00b	Mode1 (Tstrobe=Ts; strobe trigger signal $\geq 10\mu s$)
				01b	Mode 2 (Tstrobe=max Ts)
				10b	Mode 3 (Tstrobe = strobe signal)
				11b	not used

8.4.5 LED Pattern Generator

The LED pattern generator is capable of producing a pattern with 32 bits length and 1 second duration (31.25ms for each bit). The pattern itself can be started every second, every 2nd, 3rd up to 7th second¹.

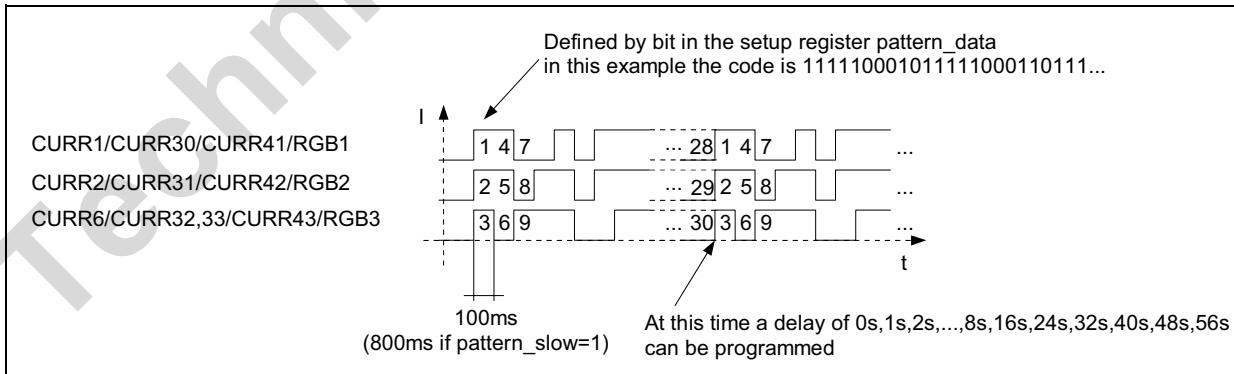

With this pattern all current sinks can be controlled. The pattern itself switches the configured current sources between 0 and their programmed current.

If everything else is switched off, the current consumption in this mode is **ACTIVE**. (excluding current through switched on current source) and the charge pump, if required. The charge pump can be automatically switched on/off depending on the pattern (set register [cp_auto_on](#) on page 20=1) to reduce the overall current consumption.

Figure 16. LED Pattern Generator AS3675 for *pattern_color* = 0

To select the different current sinks to be controlled by the LED pattern generator, see the 'xxxx'_mode registers (where 'xxxx' stands for the to be controlled current sink, e.g. curr1_mode for CURR1 current sink). See also the description of the different current sinks.

To allow the generator of a color patterns set the bit *pattern_color* to '1'. Then the pattern can be connected to CURRx as follows:

Figure 17. LED Pattern Generator AS3675 for *pattern_color* = 1

1. All times can be extended by a factor of 8 by setting *pattern_slow*=1 (this result in a delay of up to 56s)

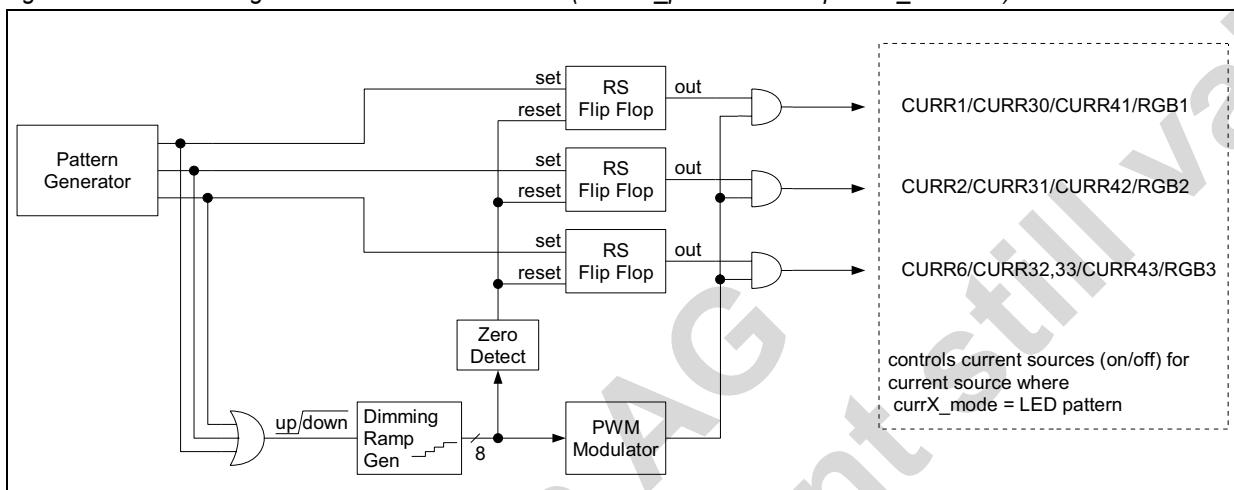

Only those current sinks will be controlled, where the 'xxxx'_mode register is configured for LED pattern.

If the register bit `pattern_slow` is set, all pattern times are increased by a factor of eight. (bit duration: 250ms if `pattern_color=0` / 800ms if `pattern_color=1`, delays between pattern up to 56s).

Soft Dimming for Pattern

The internal pattern generator can be combined with the internal pwm dimming modulator to obtain as shown in the following figure:

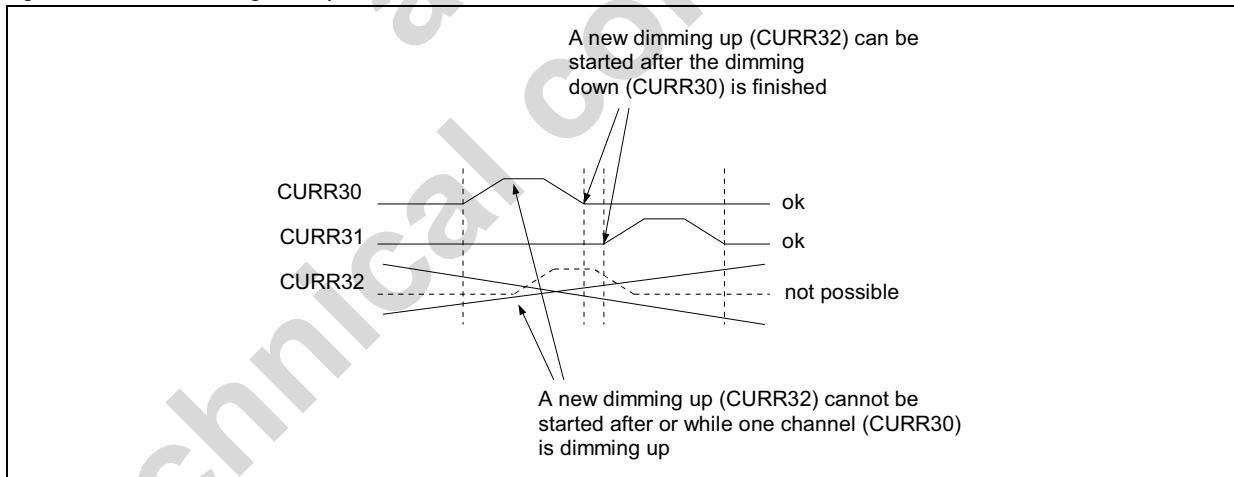

Figure 18. Soft dimming Architecture for the AS3675 (`softdim_pattern=1` and `pattern_color = 1`)

With the AS3675 smooth fade-in and fade-out effects can be automatically generated.

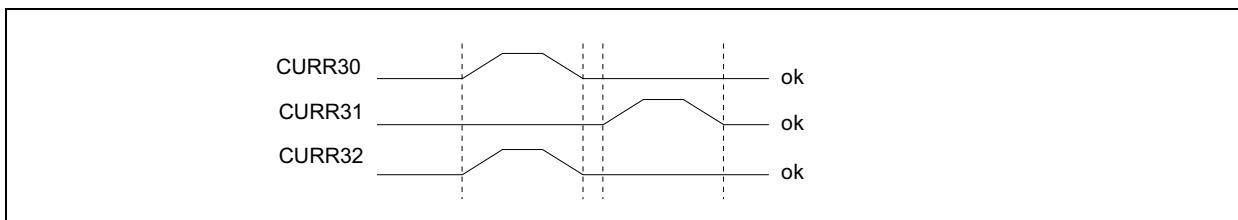

As there is only one dimming ramp generator and one pwm modulator following constraints have to be considered when setting up the pattern (applies only if `pattern_color=1`):

Figure 19. Soft dimming example Waveform for CURR30-32

However using the identical dimming waveform for two channels is possible as shown in the following figure:

Figure 20. Soft dimming example Waveform for CURR30-32

LED Pattern Registers

Table 51. *Pattern data0...Pattern data3* Registers

Addr: 19h,1Ah,1Bh,1Ch		Pattern data0, Pattern data1, Pattern data2, Pattern data3			
		This registers contains the pattern data for the current sinks.			
Bit	Bit Name	Default	Access	Description	
7:0	pattern_data[7:0] ¹	0	R/W	Pattern data0	
7:0	pattern_data[15:8]1111 ¹	0	R/W	Pattern data1	
7:0	pattern_data[23:16]1111 ¹	0	R/W	Pattern data2	
7:0	pattern_data[31:24]1111 ¹	0	R/W	Pattern data3	

1. Update any of the pattern register only if none of the current sources is connected to the pattern generator ('xxxx'_mode must not be 11b). The pattern generator is automatically started at the same time when any of the current sources is connected to the pattern generator

Table 52. *Pattern control* Register

Addr: 18h		Pattern control			
		This register controls the LED pattern			
Bit	Bit Name	Default	Access	Description	
0	pattern_color	0	R/W	Defines the pattern type for the current sinks	
				0b	single 32 bit pattern (also set currX_mode = 11)
				1b	RGB pattern with each 10 bits (set all currX_mode = 11)
2:1	pattern_delay	00b	R/W	Delay between pattern, details (see Table 55); together with pattern_delay2 sets the delay time between patterns	
3	softdim_pattern ¹	0b	R/W	Enable the 'soft' dimming feature for the pattern generator	
				0	Pattern generator directly control current sources
				1	'Soft Dimming' is performed (see page 37)

1. If softdim_pattern=1, don't set curr30_mode, curr31_mode, curr32_mode or curr33_mode to 11b.

Table 53. *gpio current* Register

Addr: 2Ch		gpio current			
Bit	Bit Name	Default	Access	Description	
4	pattern_delay2	0	R/W	Delay between pattern (see Table 55 on page 39); together with pattern_delay sets the delay time between patterns	

Table 53. *gpio current* Register (Continued)

Addr: 2Ch		gpio current			
Bit	Bit Name	Default	Access	Description	
6	pattern_slow	0	R/W	Pattern timing control	
				0b	normal mode
				1b	slow mode (all pattern times are increased by a factor of eight)

Table 54. *Pattern End* Register

Addr: 54h		Pattern End			
Bit	Bit Name	Default	Access	Description	
0	pattern_end	0	R	pattern_end is toggled from 0 to 1 (or from 1 to 0) at each end of the pattern just before restarting of the internal pattern generator at the first bit of the pattern data (can be used to synchronize the baseband software to the pattern generator) ¹	

1. pattern_end toggles whenever the AS3675 is in active mode (see [Section 8.12 Operating Modes](#) on page 71) even if no pattern data has been setup.

Table 55. LED Pattern timing

pattern_slow	pattern_delay2	pattern_delay[1..0]	bit duration [ms]		delay [s] between patterns	pattern duration [s] (total cycle time: pattern + delay)
	delay between patterns		pattern_color=0	pattern_color=1		
0	0	00	31	100	0 ¹	1
0	0	01	31	100	1	2
0	0	10	31	100	2	3
0	0	11	31	100	3	4
0	1	00	31	100	4	5
0	1	01	31	100	5	6
0	1	10	31	100	6	7
0	1	11	31	100	7	8
1	0	00	250	800	0	8
1	0	01	250	800	8	16
1	0	10	250	800	16	24
1	0	11	250	800	24	32
1	1	00	250	800	32	40
1	1	01	250	800	40	48
1	1	10	250	800	48	56
1	1	11	250	800	56	64

1. Even by setting 000 for pattern delay, there is a small delay before the new patterns starts.

8.4.6 PWM Generator

The PWM generator can be used for any current sink. The setting applies for all current sinks, which are controlled by the pwm generator (e.g. CURR1 is pwm controlled if `curr1_mode` = 10). The pwm modulated signal can switch on/off the current sinks and therefore depending on its duty cycle change the brightness of an attached LED.

Internal PWM Generator

The internal PWM generator uses the 2MHz internal clock as input frequency and its dimming range is 6 bits digital (2MHz / 2^6 = 31.3kHz pwm frequency) and 2 bits analog. Depending on the actual code in the register `pwm_code` the following algorithm is used:

If `pwm_code` bit 7 = 1

Then the upper 6 bits (Bits 7:2) of `pwm_code` are used for the 6 bits PWM generation, which controls the selected currents sinks directly

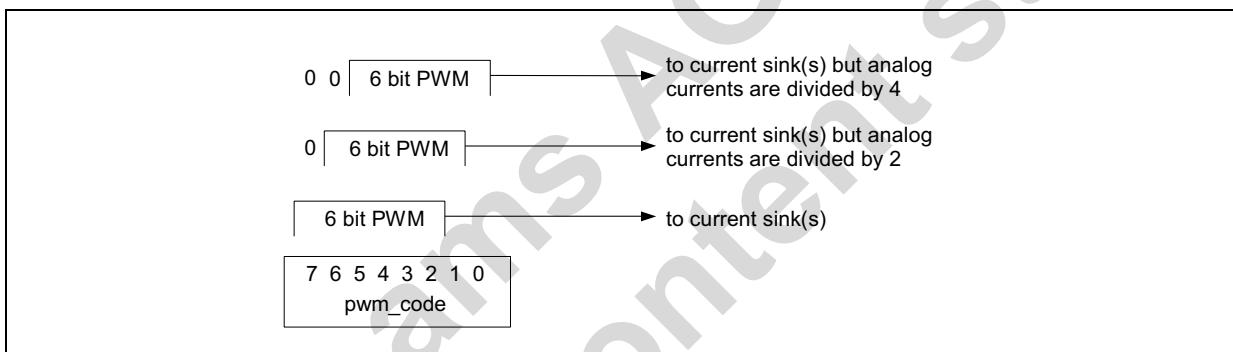

If `pwm_code` bit 7 = 0 and bit 6 = 1

Then bits 6:1 of `pwm_code` are used for the 6 bits PWM generation. This signal controls the selected current sinks, but the analog current of these sinks is divided by 2

If `pwm_code` bit 7 and bit 6 = 0

Then bits 5:0 of `pwm_code` are used for the 6 bits PWM generation. This signal controls the selected current sinks, but the analog current of these sinks is divided by 4

Figure 21. PWM Control

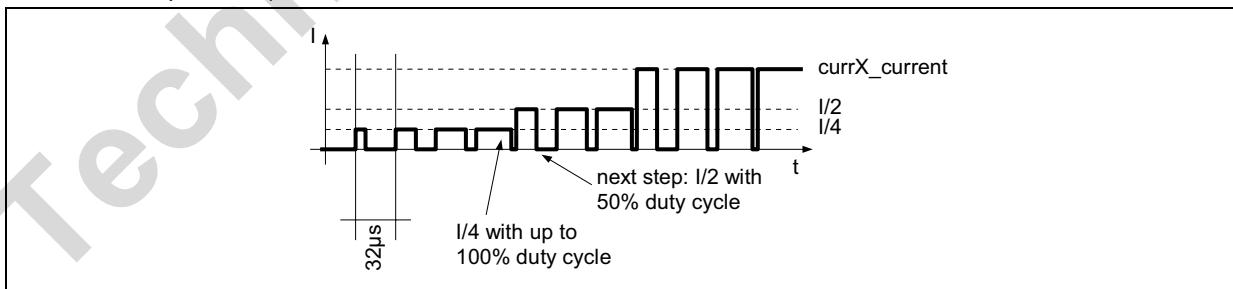

Automatic Up/Down Dimming

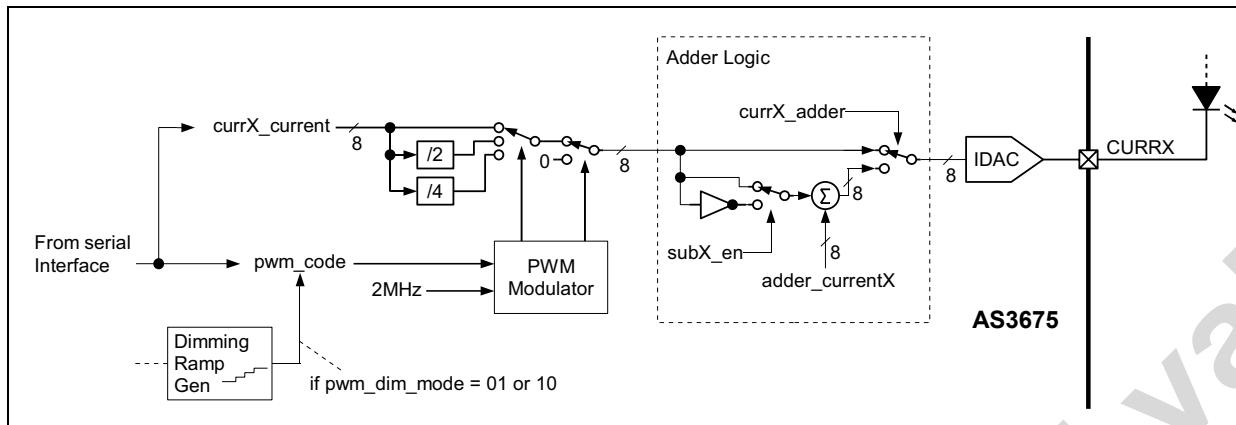

If the register `pwm_dim_mode` is set to 01 (up dimming) or 10 (down dimming) the value within the register `pwm_code` is increased (up dimming) or decreased (down dimming) every time and amount (either $1/4^{\text{th}}$ or $1/8^{\text{th}}$) defined by the register `pwm_dim_speed`. The maximum value of 255 (completely on) and the minimum value of 0 (off) is never exceeded. It is used to smoothly and automatically dim the brightness of the LEDs connected to any of the current sinks. The PWM code is readable all the time (also during up and down dimming).

The waveform for up dimming looks as follows (cycles omitted for simplicity):

Figure 22. PWM Dimming Waveform for up dimming (`pwm_dim_mode` = 01); `currX_mode` = PWM controlled (not all steps shown)

The internal pwm modulator circuit controls the current sinks as shown in the following figure:

Figure 23. PWM Control Circuit ($\text{currX_mode} = 10b$ (PWM controlled)); X = any current sink

The adder logic (available for all current sinks) is intended to allow dimming not only from 0% to 100% (or 100% to 0%) of currX_current, but also e.g. from 10% to 110% (or 110% to 10%) of currX_current. The starting current for up dimming is defined by 0 + currX_adder and the end current is defined by currX_current + currX_adder.

An overflow of the internal bus (8 Bits wide to the IDAC) has to be avoided by the register settings (currX_current + currX_adder must not exceed 255).

If the register subX_en is set, the result from the pwm modulator is inverted logically. That means for up dimming the starting current is defined by currX_adder - 1 and the end current is defined by currX_adder - currX_current - 1. An overflow of the internal bus (8 Bits wide to the IDAC) has to be avoided by the register settings (currX_adder - currX_current - 1 must not be below zero).

Its purpose is to dim one channel e.g. CURR30 from e.g. 110% to 10% of curr30_current and at the same time dim another channel e.g. CURR31 from 20% to 120% of curr31_current.

Note: The adder logic operates independent of the currX_mode setting, but its main purpose is to work together with the pwm modulator (improved up/down dimming)

If the adder logic is not used anymore, set the bit currX_adder to 0. (Setting adder_currentX to 0 is not sufficient)

At the end of up/down dimming, the `pwm_code` register keeps its final value (for up-dimming 255 and for down-dimming 0). This can be used to identify the exact time, when up/down dimming is finished.

Table 56. PWM Dimming Table

Table 61. Adder Current 3 Register

Addr: 32h		Adder Current 3			
		This register defines the current which can be added to CURR6, CURR32, CURR43, RGB3			
Bit	Bit Name	Default	Access	Description	
7:0	adder_current3	00b	R/W	Selects the added current value – do not exceed together with currX_current the internal 8 Bit range (see text)	
				00h	0 (represents 0mA)
			
				FFh	255 (represents 38.25mA)

Table 62. Adder Current 4 Register

Addr: 52h		Adder Current 4			
		This register defines the current which can be added to CURR33			
Bit	Bit Name	Default	Access	Description	
7:0	adder_current4	00b	R/W	Selects the added current value – do not exceed together with currX_current the internal 8 Bit range (see text)	
				00h	0 (represents 0mA)
			
				FFh	255 (represents 38.25mA)

Table 63. Adder Enable 1 Register

Addr: 33h		Adder Enable 1		
		Enables the adder circuit for the selected current sources		
Bit	Bit Name	Default	Access	Description
0	rgb1_adder	0	R/W	Enables adder circuit for current source RGB1
				0 Normal Operation of the current source
				1 adder_current1 gets added to the current source current
1	rgb2_adder	0	R/W	Enables adder circuit for current source RGB2
				0 Normal Operation of the current source
				1 adder_current2 gets added to the current source current
2	rgb3_adder	0	R/W	Enables adder circuit for current source RGB3
				0 Normal Operation of the current source
				1 adder_current3 gets added to the current source current
3	curr41_adder	0	R/W	Enables adder circuit for current source CURR41
				0 Normal Operation of the current source
				1 adder_current1 gets added to the current source current
4	curr42_adder	0	R/W	Enables adder circuit for current source CURR42
				0 Normal Operation of the current source
				1 adder_current2 gets added to the current source current
5	curr43_adder	0	R/W	Enables adder circuit for current source CURR43
				0 Normal Operation of the current source
				1 adder_current3 gets added to the current source current

Table 64. Adder Enable 2 Register

Addr: 34h		Adder Enable 2		
		Enables the adder circuit for the selected current sources		
Bit	Bit Name	Default	Access	Description
0	curr1_adder	0	R/W	Enables adder circuit for current source CURR1
				0 Normal Operation of the current source
				1 adder_current1 gets added to the current source current
1	curr2_adder	0	R/W	Enables adder circuit for current source CURR2
				0 Normal Operation of the current source
				1 adder_current2 gets added to the current source current
2	curr6_adder	0	R/W	Enables adder circuit for current source CURR6
				0 Normal Operation of the current source
				1 adder_current3 gets added to the current source current

Table 64. Adder Enable 2 Register (Continued)

Addr: 34h		Adder Enable 2		
		Enables the adder circuit for the selected current sources		
Bit	Bit Name	Default	Access	Description
3	curr30_adder	0	R/W	Enables adder circuit for current source CURR30
				0 Normal Operation of the current source
				1 adder_current1 gets added to the current source current
4	curr31_adder	0	R/W	Enables adder circuit for current source CURR31
				0 Normal Operation of the current source
				1 adder_current2 gets added to the current source current
5	curr32_adder	0	R/W	Enables adder circuit for current source CURR32
				0 Normal Operation of the current source
				1 adder_current3 gets added to the current source current
6	curr33_adder	0	R/W	Enables adder circuit for current source CURR33
				0 Normal Operation of the current source
				1 adder_current4 gets added to the current source current

Table 65. Subtract Enable Register

Addr: 35h		Subtract Enable		
		Enable the inversion from the signal from the pwm generator		
Bit	Bit Name	Default	Access	Description
0	sub_en1	0	R/W	Inverts the signal from the pwm generator
				0 Direct Operation (no inversion)
				1 The signal from the pwm generator for which the adder is enabled (curr1_adder = 1, curr30_adder = 1, rgb1_adder = 1, curr41_adder = 1) is inverted
1	sub_en2	0	R/W	Inverts the signal from the pwm generator
				0 Direct Operation (no inversion)
				1 The signal from the pwm generator for which the adder is enabled (curr2_adder = 1, curr31_adder = 1, rgb2_adder = 1, curr42_adder = 1) is inverted
2	sub_en3	0	R/W	Inverts the signal from the pwm generator
				0 Direct Operation (no inversion)
				1 The signal from the pwm generator for which the adder is enabled (curr6_adder = 1, curr32_adder = 1, rgb3_adder = 1, curr43_adder = 1) is inverted

Table 65. Subtract Enable Register (Continued)

Addr: 35h		Subtract Enable		
		Enable the inversion from the signal from the pwm generator		
Bit	Bit Name	Default	Access	Description
3	sub_en4	0	R/W	Inverts the signal from the pwm generator
				0 Direct Operation (no inversion)
				1 The signal from the pwm generator for which the adder is enabled (curr33_adder = 1) is inverted

8.5 General Purpose Input / Output

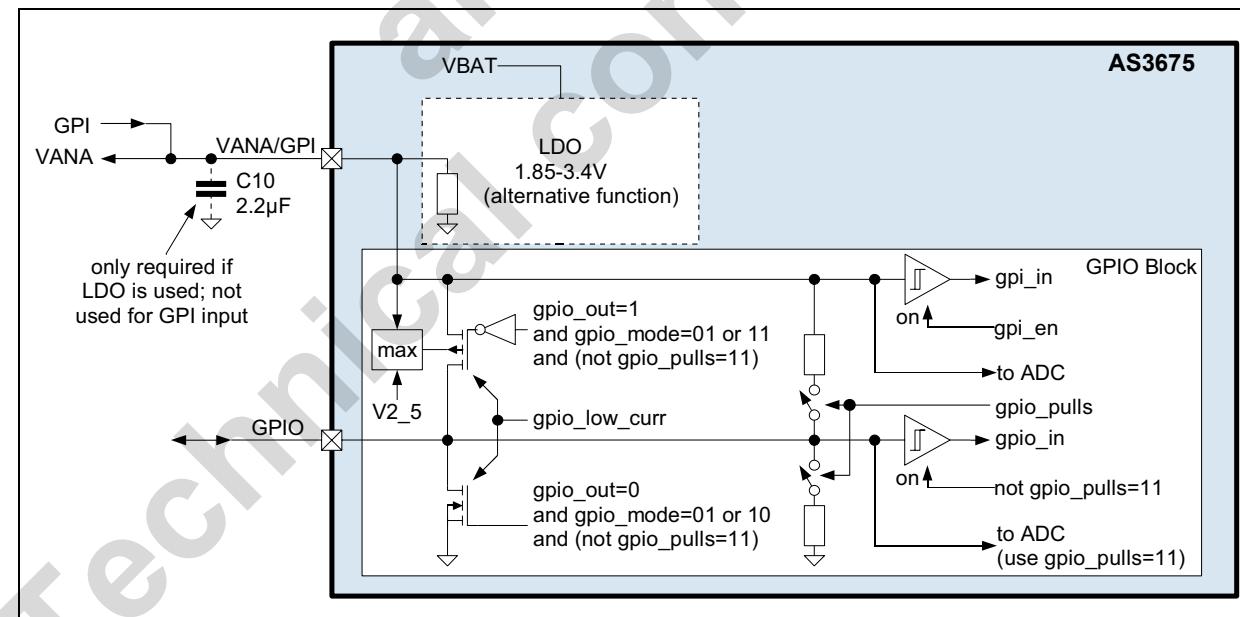

The GPIO is a highly-configurable general purpose input/output pin which can be used for the following functionality:

- Digital Schmitt Trigger Input
- Digital Output with 4mA Driving Capability at 2.8V Supply (VANA)
- Tristate Output
- Analog Input to the ADC
- Default Mode for GPIO and VANA/GPI is Input (Pull-Down)

Table 66. GPIO Pin Function Summary

GPIO Pin	Configuration	Additional Function
GPIO	Digital Input, Totem-Pole Output (Push/Pull), Open Drain (PMOS or NMOS), High-Z, Pull-Down or Pull-Up Resistor	ADC Input
VANA/GPI	Digital Input	ADC Input, LDO output

Figure 24. GPIO and VANA/GPI Blockdiagram

8.5.1 Unused GPIO Pin

If the pin GPIO is not used, they can be left open (an internal pulldown, which is enabled by default, will pull them to GND).

8.5.2 GPIO Characteristics

Table 67. GPIO DC Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
Rpull	Pull up/Pull down Resistance	enabled by gpio_pulls	30		75	kΩ
VGPIO	Supply Voltage	=VANA/GPI	1.5		3.4	V
VIH	High Level Input Voltage		0.7·VANA min. 1.75V			V
VIL	Low Level Input Voltage				0.3· VANA min. 0.75V	V
VHYS	Hysteresis		0.1· VANA min. 250mV			V
I _{LEAK}	Input Leakage Current	To V2_5 or VANA/GPI and VSS	-5		5	μA
VOH	High Level Output Voltage	at I _{out}	0.8·VANA			V
VOL	Low Level Output Voltage	at I _{out}			0.2· VANA	V
I _{OUT}	Driving Capability	VANA/GPI = 2.8V, gpio_low_curr = 1	4			mA
		VANA/GPI = 2.8V, gpio_low_curr = 0	16			
CLOAD	Capacitive Load				50	pF

8.5.3 GPIO Registers

Table 68. GPIO output 1 Register

Addr: 05h		GPIO output 1			
		This register controls GPIO outputs.			
Bit	Bit Name	Default	Access	Description	
0	gpi_curr1_en	0	R/W	Enables the CURR1 input	
				0	input disabled
				1	input enabled
1	gpi_curr2_en	0	R/W	Enables the CURR2 input	
				0	input disabled
				1	input enabled
2	gpi_curr6_en	0	R/W	Enables the CURR6 input	
				0	input disabled
				1	input enabled
3				not used	
4	gpi_curr30_en	0	R/W	Enables the CURR30 input	
				0	input disabled
				1	input enabled

				0	input disabled
				1	input enabled
5	gpi_curr41_en	0	R/W	Enables the CURR41 input	
				0	input disabled
				1	input enabled
6	gpi_curr42_en	0	R/W	Enables the CURR42 input	
				0	input disabled
				1	input enabled
7	gpi_curr43_en	0	R/W	Enables the CURR43 input	
				0	input disabled
				1	input enabled

Table 71. *GPIO signal 2 Register*

Addr: 51h		GPIO signal 2			
		This register controls GPIO outputs.			
Bit	Bit Name	Default	Access	Description	
0	gpio_in	N/A	R	Reads a logic signal from pin GPIO; this is independent of any other setting e.g., Table 72 except gpi_pulls=11	
1	gpi_in	N/A	R	Reads a logic signal from pin VANA/GPI; if gpi_en=1	
2	gpi_rgb1_in	N/A	R	Reads a logic signal from pin RGB1; if gpi_rgb1_en=1	
3	gpi_rgb2_in	N/A	R	Reads a logic signal from pin RGB2; if gpi_rgb2_en=1	
4	gpi_rgb3_in	N/A	R	Reads a logic signal from pin RGB3; if gpi_rgb3_en=1	
5	gpi_curr41_in	N/A	R	Reads a logic signal from pin CURR41; if gpi_curr41_en=1	
6	gpi_curr42_in	N/A	R	Reads a logic signal from pin CURR42; if gpi_curr42_en=1	
7	gpi_curr43_in	N/A	R	Reads a logic signal from pin CURR43; if gpi_curr43_en=1	

Table 72. *GPIO control Register*

Addr: 1Eh		GPIO control			
		This register controls GPIO and GPIO1 pin functions.			
Bit	Bit Name	Default	Access	Description	
1:0	gpio_mode	00	R/W	Defines the direction for pin GPIO	
				00	Input only
				01	Output (push and pull)
				10	Output (open drain, only push; only NMOS is active)
				11	Output (open drain, only pull; only PMOS is active)

Table 72. *GPIO control Register (Continued)*

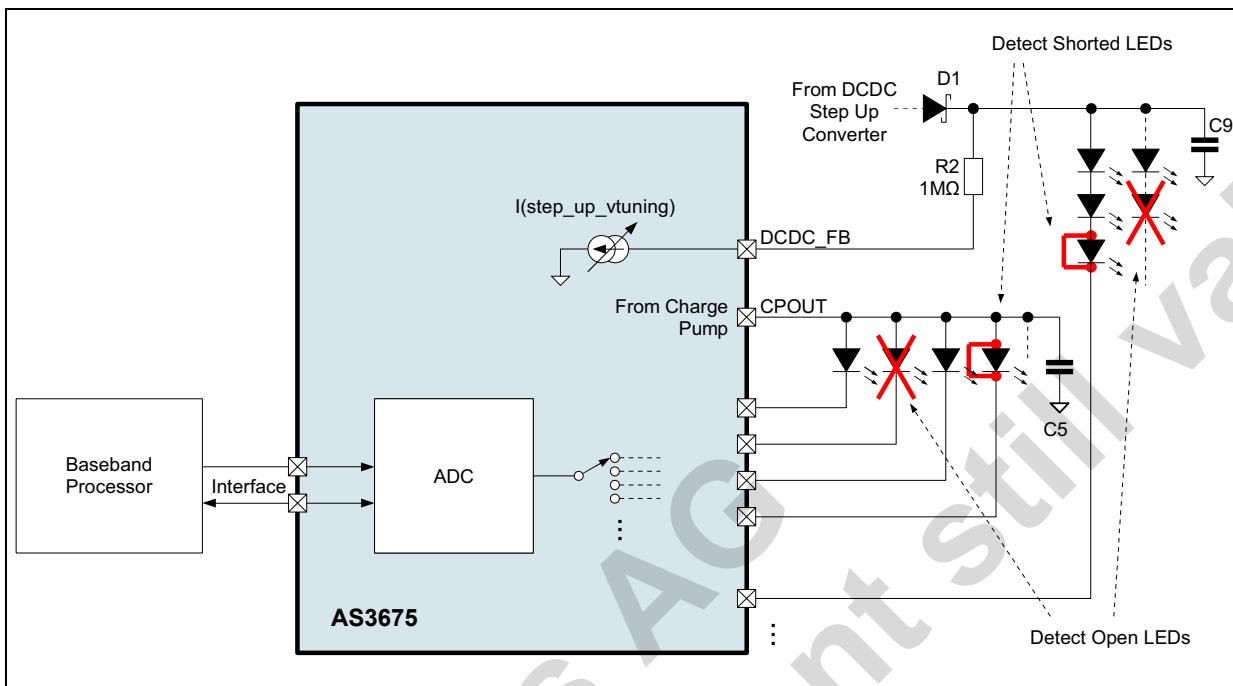

Addr: 1Eh		GPIO control			
		This register controls GPIO and GPIO1 pin functions.			
Bit	Bit Name	Default	Access	Description	
3:2	gpio_pulls	01	R/W	Adds the following pullup/pulldown to pin GPIO; this is independent of setting of bits gpio_mode	
				00	None
				01	Pulldown
				10	Pullup
				11	ADC input (gpio_mode = XX); recommended for analog signals

Table 73. *GPIO driving cap Register*

Addr: 20h		GPIO driving cap			
		This register enables low current mode for GPIOs.			
Bit	Bit Name	Default	Access	Description	
0	gpio_low_curr	0	R/W	Defines the driving capability of pin GPIO	
				0	Iout
				1	Iout /4

8.6 LED Test

Figure 25. LED Function Testing

The AS3675 supports the verification of the functionality of all the connected LEDs (open and shorted LEDs can be detected). This feature is especially useful in production test to verify the correct assembly of the LEDs, all its connectors and cables. It can also be used in the field to verify if any of the LEDs is damaged. A damaged LED can then be disabled (to avoid unnecessary currents).

The current sources, charge pump, dc/dc converter and the internal ADC are used to verify the forward voltage of the LEDs. If this forward voltage is within the specified limits of the LEDs, the external circuitry is assumed to operate.

8.6.1 Function Testing for single LEDs connected to the Charge Pump

For any current source connected to the charge pump (CURR30-33) where only one LED is connected between the charge pump and the current sink (see Figure 1) use:

Table 74. Function Testing for LEDs connected to the Charge Pump

Step	Action	Example Code
1	Switch on the charge pump and set it into manual 1:2 mode (to avoid automatic mode switching during measurements)	Reg 23h ≤ 14h (<code>cp_mode = 1:2, manual</code>) Reg 00h ≤ 04h (<code>cp_on = 1</code>)
2	Switch on the current sink for the LED to be tested	e.g. for register CURR31 set to 9mA use Reg 10h ≤ 0Fh (<code>curr3x_other = 9mA</code>) Reg 03h ≤ 0ch (<code>curr31_mode = curr31_other</code>)
3	Measure with the ADC the voltage on CPOUT	Reg 26h ≤ 95h (<code>adc_select=CPOUT,start ADC</code>) Fetch the ADC result from Reg 27h and 28h
4	Measure with the ADC the voltage on the switched on current sink	Reg 26h ≤ 8bh (<code>adc_select=CURR31,start ADC</code>) Fetch the ADC result from Reg 27h and 28h
5	Switch off the current sink for the LED to be tested	Reg 03h ≤ 00h (<code>curr31_mode = off</code>)
6	Compare the difference between the ADC measurements (which is the actual voltage across the tested LED) against the specification limits of the tested LED	Calculation performed in baseband uProcessor

Table 74. Function Testing for LEDs connected to the Charge Pump

Step	Action	Example Code
7	Do the same procedure for the next LED starting from point 2	Jump to 2. If not all the LEDs have been tested
8	Switch off the charge pump set charge pump automatic mode	Reg 00h ≤ 00h (<code>cp_on</code> = 0) Reg 23h ≤ 00h

8.6.2 Function Testing for LEDs connected to the Step Up DCDC Converter

For LEDs connected to the DCDC converter (usually current sinks CURR1,CURR2 and CURR6) use the following procedure:

Table 75. Function Testing for LEDs connected to the DCDC converter

Step	Action	Example Code
1	Switch on the current sink for the LED string to be tested (CURR1,2 or 6)	e.g. Test LEDs on CURR1: Reg 01h ≤ 01h (<code>curr1_mode</code> =on) Reg 09h ≤ 3ch (<code>curr1_current</code> = 9mA)
2	Select the feedback path for the LED string to be tested (e.g. <code>step_up_fb</code> = 01 for LED string on CURR1)	Reg 21h ≤ 02h (<code>step_up_fb</code> =curr1)
3	Set the current for <code>step_up_vtuning</code> exactly above the maximum forward voltage of the tested LED string + 0.6V (for the current sink) + 0.25V; add 6% margin (accuracy of <code>step_up_vtuning</code>); this sets the maximum output voltage limit for the DCDC converter	e.g. 4 LEDs with $U_{fMAX} = 4.1V$ gives $17.25V + 6\% = 18.29V$; if $R2=1M\Omega$ and $R3$ = open, then select <code>step_up_vtuning</code> = 18 (Reg 21h ≤ 92h; results in 19.25V over voltage protection voltage – Table 9 on page 14)
4	Set <code>step_up_prot</code> = 1	Reg 22h ≤ 04h
5	Switch on the DCDC converter	Reg 00h ≤ 08h
6	Wait 80ms (DCDC_FB settling time)	
7	Measure the voltage on DCDC_FB (ADC)	Reg 26h ≤ 96h (<code>adc_select</code> =DCDC_FB, start ADC; Fetch the ADC result from Reg 27h and 28h)
8	If the voltage on DCDC_FB is above 1.0V, the tested LED string is broken – then skip the following steps	(Code >199h)
9	Switch off the over voltage protection (<code>step_up_prot</code> =0)	Reg 22h ≤ 00h
10	Reduce <code>step_up_vtuning</code> step by step until the measured voltage on DCDC_FB (ADC) is above 1.0V. After changing <code>step_up_vtuning</code> always wait 80ms, before AD-conversion	e.g.: Reg 21h ≤ 62h (<code>step_up_vtuning</code> =12): ADC result=1,602V
11	Measure voltage on DCDC_FB	e.g. DCDC_FB=1.602V
12	Switch off the DCDC converter	Reg 00h ≤ 00h
13	The voltage on the LED string can be calculated now as follows (R4 = open): $V_{LEDSTRING} = V(DCDC_FB) + I(\text{step_up_vtuning}) * R2 - 0.5V$ (current sinks feedback voltage: VFB2). $V(DCDC_FB) = \text{ADC Measurement from point 11}$ $I(\text{step_up_vtuning}) = \text{last setting used for point 10}$	e.g.: $V_{LED} = (1.602V + 12V - 0.5V) / 4 = 3.276V$
14	Compare the calculated value against the specification limits of the tested LEDs	

Note: With the above described procedures electrically open and shorted LEDs can be automatically detected

8.7 Analog-to-Digital Converter

The AS3675 has a built-in 10-bit successive approximation analog-to-digital converter (ADC). It is internally supplied by V_{2_5}, which is also the full-scale input range (0V defines the ADC zero-code). For input signals exceeding V_{2_5} (typ. 2.5V) a resistor divider with a gain of 0.4 (Ratioprescaler) is used to scale the input of the ADC converter. Consequently the resolution is:

Table 76. ADC Input Ranges, Compliances and Resolution

Channels (Pins)	Input Range	V _{LSB}	Note
DCDC_FB, GPIO, AUDIO_IN, VANA/GPI, audio controlled LED buffer output	0V-2.5V	2.44mV	V _{LSB} =2.5/1024
ADCTEMP_CODE	-30°C to 125°C	1 / ADC _{Tc}	junction temperature
CURR30-33, CURR4x, RGBx VBAT, CPOUT	0V-5.5V	6.1mV	V _{LSB} =2.5/1024 * 1/0.4; internal resistor divider used
CURR1, CURR2, CURR6	0V-1.0V	2.44mV	V _{LSB} =2.5/1024

Table 77. ADC Parameters

Symbol	Parameter	Condition	Min	Typ	Max	Unit
	Resolution		10			Bit
V _{IN}	Input Voltage Range	V _{SUPPLY} = V _{2_5}	V _{SS}		see Table 76	V
DNL	Differential Non-Linearity			± 0.25		LSB
INL	Integral Non-Linearity			± 0.5		LSB
V _{os}	Input Offset Voltage			± 0.25		LSB
R _{in}	Input Impedance		100			MΩ
C _{in}	Input Capacitance				9	pF
V _{SUPPLY} (V _{2_5})	Power Supply Range	± 2%, internally trimmed.		2.5		V
I _{dd}	Power Supply Current	During conversion only.		500		µA
I _{dd}	Power Down Current			100		nA
T _{TOL}	Temperature Sensor Accuracy	@ 25 °C	-10		+10	°C
ADC _{OFFSET}	ADC temperature measurement offset value			375		°C
ADC _{Tc}	Code temperature coefficient	Temperature change per ADC LSB		1.293 9		°C/ Code
RatioPRESCALE_R	Ratio of Prescaler	For all low voltage current sinks, CPOUT and VBAT		0.4		
Transient Parameters (2.5V, 25 °C)						
T _c	Conversion Time	All signals are internally generated and triggered by start_conversion		27		µs
f _c	Clock Frequency			1.0		MHz
t _s	Settling Time of S&H			16		µs

The junction temperature (T_{JUNCTION}) can be calculated with the following formula (ADCTEMP_CODE is the adc conversion result for channel 04h selected by register `adc_select` = 000100b):

$$T_{JUNCTION} [^{\circ}\text{C}] = \text{ADC}_{OFFSET} - \text{ADC}_{Tc} \cdot \text{ADCTEMP_CODE} \quad (\text{EQ } 5)$$

ADC Registers

6				NA
7	start_conversion	N/A	W	Writing a 1 into this bit starts one ADC conversion cycle.

1. See Table Table 76 for ADC ranges and resolution.

Figure 26. ADC Circuit

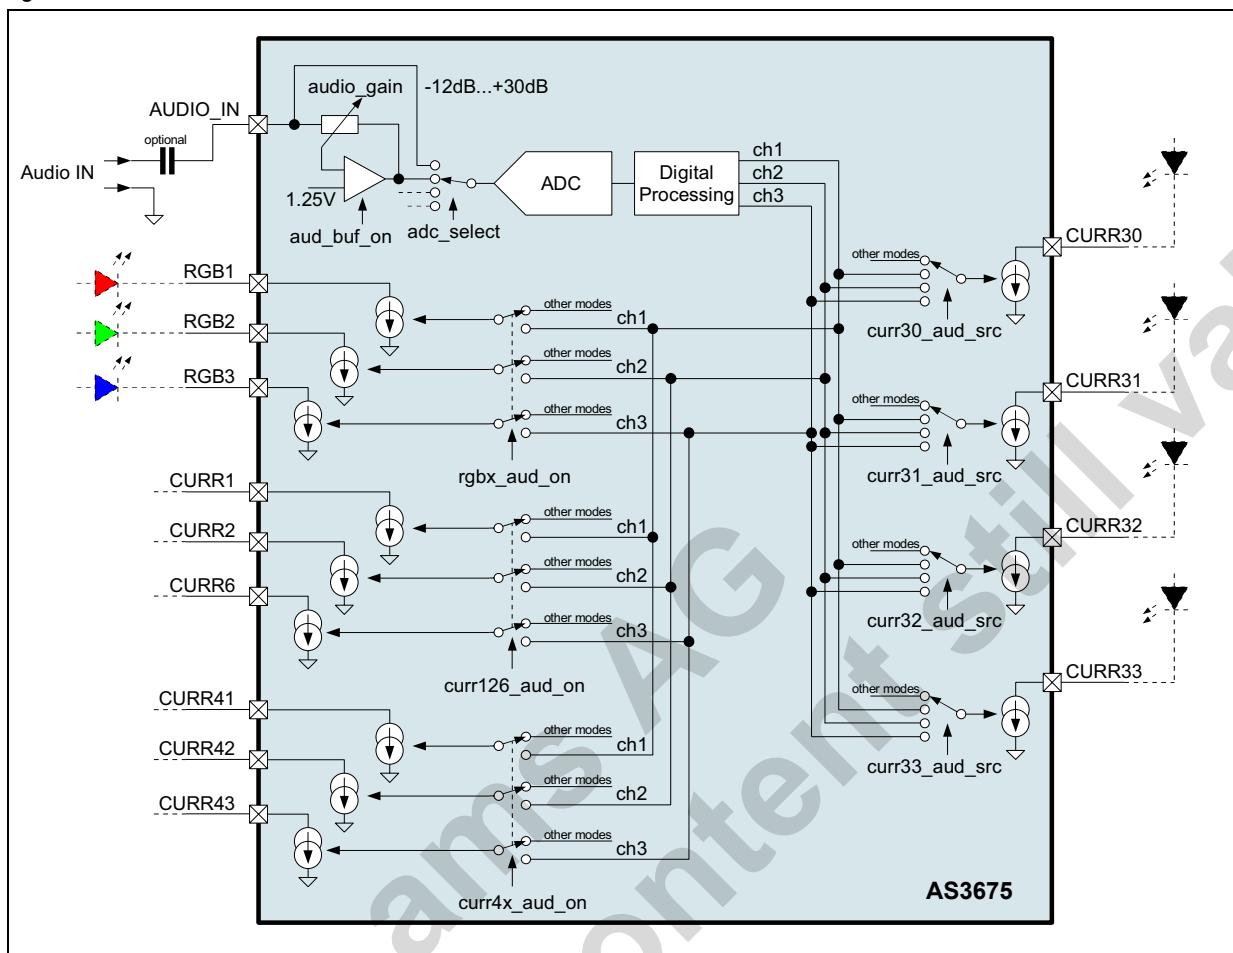

8.8 Audio controlled LEDs

Up to four RGB LEDs and/or up to 13 LEDs (number of LEDs is fully configurable) can be controlled by an audio source (connected to the pin AUDIO_IN). The audio controlled LED block can operate in two modes:

Amplitude Mode: The color of the RGB LED(s) or the brightness of the single color LED(s) is depending on the input amplitude. For the RGB LEDs it starts from black transitions to blue, green, cyan, yellow, red and for high amplitudes white is used (internal lookup table if [audio_color=000b](#)).

Frequency Mode: Three internal fully configurable filters define the brightness of the single color LED(s) or the color of the RGB LED(s). Each of the filters can be configured individually in amplitude, frequency response and type (lowpass filter, bandpass filter, highpass filter).

Figure 27. Audio controlled LED internal circuit

The audio controlled LED block is enabled if any of the registers [curr30_aud_src\[1:0\]...curr33_aud_src\[1:0\]](#), [curr126_aud_on](#), [rgbx_aud_on](#) or [curr4x_aud_on](#) not equal zero.

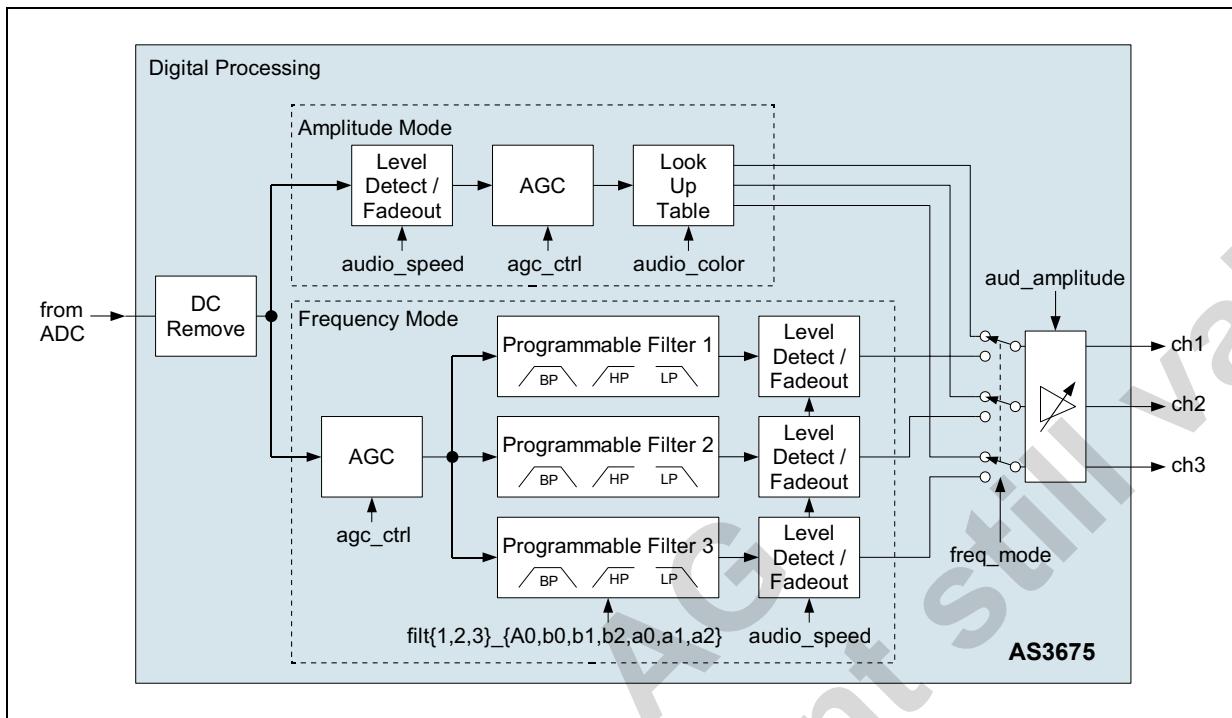

The audio input amplifier (enabled by [aud_buf_on=1](#)) is used to allow the attenuation (or amplification of the input signal) and has the following parameters:

Table 81. Audio input Parameters

Symbol	Parameter	Condition	Min	Typ	Max	Unit
VIN	Input Voltage Range		0		2.5	V
Rin_min	min. Input Impedance	at max. input gain (30dB)		20		kΩ

The signal is converted with the ADC (If the audio controlled LED is active, the internal ADC is continuously running at a sample frequency of 45.4kHz. In this case the ADC cannot be used for any other purpose). The digital processing converts this signal into 3 channels (ch1, ch2, ch3):

Figure 28. Audio controlled LED digital processing internal circuit

These three output channels (ch1, ch2, ch3) can be routed to any of the current sources according to Figure 27.

The digital processing can be done in two different operating modes (defined by the register bit `freq_mode`):

8.8.1 Amplitude Mode

This mode is selected by `freq_mode`=0.

The input amplitude is mapped into different colors for RGB LED(s) or brightness for single color LED(s). The mapping is controlled by the register `audio_color`. If `audio_color` = 000, then the mapping is done as follows:

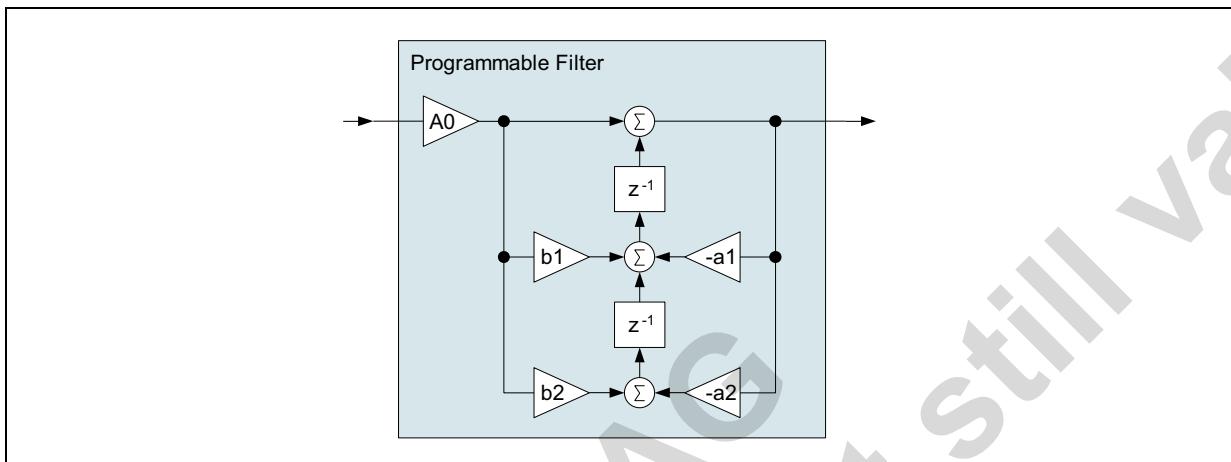

Very low amplitudes are mapped to black, for higher amplitudes, the color smoothly transitions from blue, green, cyan, yellow, red and eventually to white (for high input amplitudes).

8.8.2 Frequency Mode

This mode is selected by `freq_mode=1`.

The input signal is frequency filtered by three digital filters. The filters are 2nd order biquad IIR (infinite impulse response filters). Each of these filters has the following structure (sampling frequency = 45.4kHz / internal clock of 1MHz divided by 22):

Figure 29. Audio controlled LED frequency filter

The mathematical formula for these filters is:

$$y(n) = A0(x(n) + b1 x(n-1) + b2 x(n-2)) - a1 y(n-1) - a2 y(n-2) \quad (\text{EQ 6})$$

The internal calculation is preformed using 12bits coefficients (state variables (z^{-1}) are rounded to 12bit, the output uses 8bits). All coefficients can be set individually for each of the three filters (filter1, filter2, filter3). (see [Audio Controlled LED Registers on page 62](#)), registers `filt_type` (70h) and registers 71h to 82h. It is recommended to use austriamicrosystems 'Demoboard Software' for simple control of the filter cutoff frequencies and filter type.

Note: Do not set filter cutoff frequencies below 500Hz.

8.8.3 AGC

The AGC (available in amplitude and frequency mode) is used to 'compress' the input signal and to attenuate very low input amplitude signals (this is performed to ensure no light output for low signals especially for noisy input signals).

The AGC monitors the input signal amplitude and filters this amplitude with a filter with a short attack time, but a long decay time (decay time depends on the register `agc_ctrl`). This amplitude measurement (represented by an integer value from 0 to 15) is then used to amplify or attenuate the input signal with one of the following amplification ratios (output to input ratio) – the curve A, B, or C is selected depending on the register `agc_ctrl`:

Figure 30. AGC curve A (x-axis: input amplitude, y-axis: output amplitude; actual value: gain between output to input)

				11	band pass filter; filt3_b1=0, filt3_b2=-1

Registers 71h to 82h define the filter coefficients $\text{filt}\{1,2,3\}_{\{A0,a1,a2\}}$. Each of the coefficients is 12 bits wide and is calculated according to the following formula (2s complement number):

- Bit11 is used as sign bit 0...positive number, 1...negative number
- Bit10 is multiplied by 2^{10}
- Bit9 is multiplied by 2^9
- ...
- Bit 1 is multiplied by 2^0

- Bit 0 is multiplied by 2^10

8.9 Power-On Reset

The internal reset is controlled by two sources:

- VBAT Supply
- Serial interface state (CLK, DATA)

The internal reset is forced if VBAT is low or if both interface pins (CLK, DATA) are low for more than tPOR_DEB (typ. 100ms)². Then device enters shutdown mode.

The reset levels control the state of all registers. As long as VBAT and CLK/DATA are below their reset thresholds, the register contents are set to default. Access by serial interface is possible once the reset thresholds are exceeded.

2. Only if shutdown_enab=1

Figure 33. Zero Power Device Wakeup block diagram

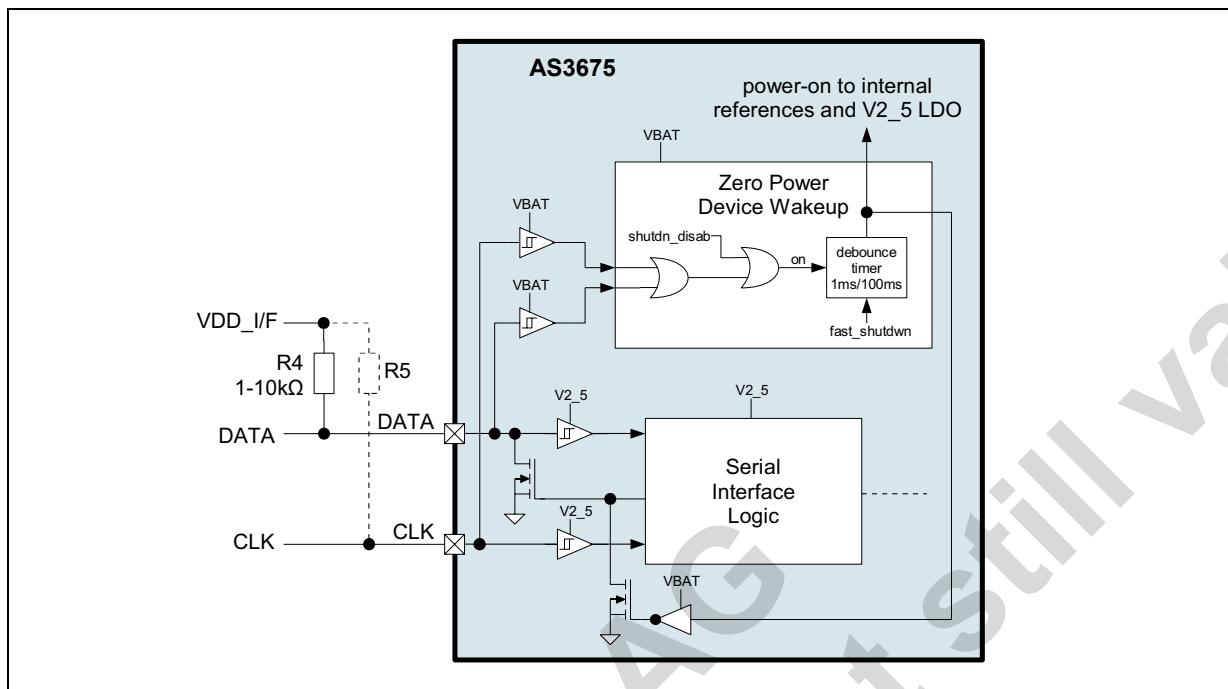

Table 88. Audio input Parameters

Symbol	Parameter	Condition	Min	Typ	Max	Unit
VPOR_VBAT	Overall Power-On Reset	Monitor voltage on V2_5; power-on reset for all internal functions.	1.8	2.15	2.4 ¹	V
VPOR_PERI	Reset Level for pins CLK, DATA	Monitor voltage on pins CLK, DATA	0.29	1.0	1.38	V
tPOR_DEB	Reset debounce time for pins CLK, DATA		80	100	120	ms
tstart	Interface Startup Time		4	6	8	ms

1. Guaranteed by design - min./max. limits not production tested

8.9.1 Reset control register

Table 89. Overtemp control Register

Addr: 29h		Overtemp control			
		This register reads and resets the overtemperature flag.			
Bit	Bit Name	Default	Access	Description	
4	shutdown_enab	0	R/W	Enable Shutdown mode and serial interface reset.	
				0	Serial Interface reset disabled. Device does not enter Shutdown mode
				1	Serial Interface reset enabled, device enters shutdown when SCL and SDA remain low for min. 120ms

8.10 Temperature Supervision

An integrated temperature sensor provides over-temperature protection for the AS3675. This sensor generates a flag if the device temperature reaches the overtemperature threshold of 140°. The threshold has a hysteresis to prevent oscillation effects.

If the device temperature exceeds the T₁₄₀ threshold all current sources, the charge pump and the dc/dc converter is disabled and the `ov_temp` flag is set. After decreasing the temperature by THYST operation is resumed.

The `ov_temp` flag can only be reset by first writing a 1 and then a 0 to the register bit `rst_ov_temp`.

Bit `ov_temp_on` = 1 activates temperature supervision [Table 91](#). It is recommended to leave this bit set (default state).

Table 90. Overtemperature Detection

Symbol	Parameter	Condition		Min	Typ	Max	Unit
T ₁₄₀	ov_temp Rising Threshold				140		°C
THYST	ov_temp Hysteresis				5		°C

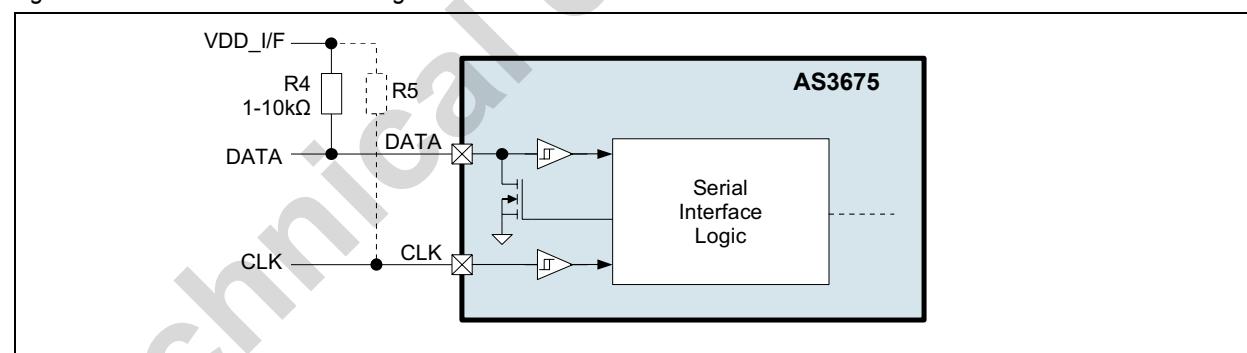

Table 91. Overtemp control Register

Addr: 29h		Overtemp control				
		This register reads and resets the overtemperature flag.				
Bit	Bit Name	Default	Access	Description		
0	ov_temp_on	1	W	Activates/deactivates device temperature supervision. Default: Off - all other bits are only valid if this bit is set to 1		
				0	Temperature supervision is disabled. No reset will be generated if the device temperature exceeds 140°C	
				1	Temperature supervision is enabled	
1	ov_temp	N/A	R	1	Indicates that the overtemperature threshold has been reached; this flag is not cleared by an overtemperature reset. It has to be cleared using <code>rst_ov_temp</code>	
2	rst_ov_temp	0	R/W	The ov_temp flag is cleared by first setting this bit to 1, and then setting this bit to 0.		

8.11 Serial Interface

The AS3675 is controlled using serial interface pins CLK and DATA:

Figure 34. Serial interface block diagram

The clock line CLK is never held low by the AS3675 (as the AS3675 does not use clock stretching of the bus).

Table 92. Serial Interface Timing

Symbol	Parameter	Condition	Min	Typ	Max	Unit
V _{IHI/F}	High Level Input Voltage	Pins DATA and CLK	1.38		V _{BAT}	V
V _{ILI/F}	Low Level Input Voltage		0.0		0.52	V
V _{HYST/F}	Hysteresis			0.1		V
t _{RISE}	Rise Time		0		1000	ns
t _{FALL}	Fall Time		0		300	ns
t _{CLK_FILTER}	Spike Filter on CLK			100		ns
t _{DATA_FILTER}	Spike Filter on DATA			300		ns

The AS3675 is compatible to the NXP two wire specification http://www.nxp.com/acrobat_download/literature/9398/39340011.pdf, Version 2.1, January 2000 for standard and fast mode (no high speed mode) with the following exception:

Data set-up time for fast mode: tsu;DAT=250ns (instead of 100ns from table 5, p32)

8.11.1 Serial Interface Features

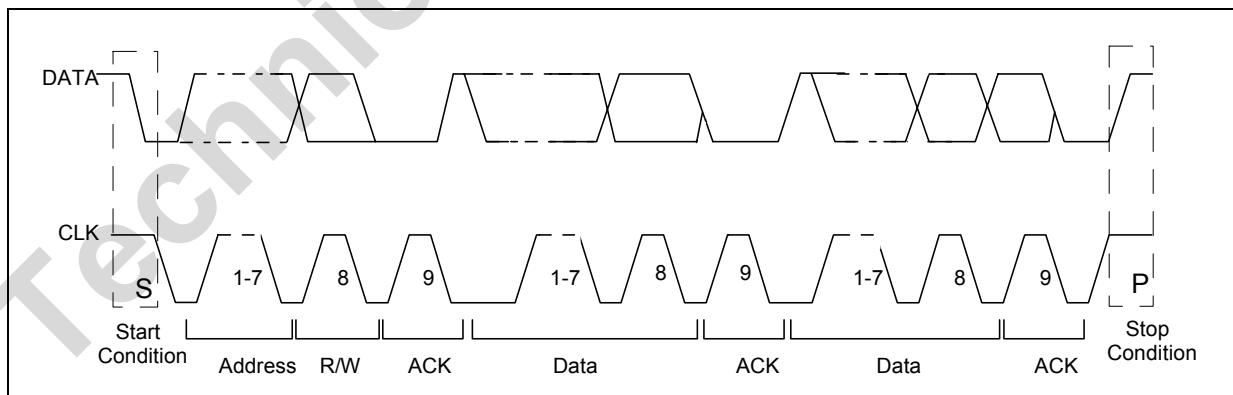

- Fast Mode Capability (Maximum Clock Frequency is 400 kHz)
- 7-bit Addressing Mode
- Write Formats
 - Single-Byte Write
 - Page-Write
- Read Formats
 - Current-Address Read
 - Random-Read
 - Sequential-Read
- DATA Input Delay and CLK spike filtering by integrated RC components

8.11.2 Device Address Selection

The serial interface address of the AS3675 has the following address:

- 80h – Write Commands
- 81h – Read Commands

Figure 35. Complete Serial Data Transfer

Serial Data Transfer Formats

Definitions used in the serial data transfer format diagrams are listed in the following table:

Table 93. Serial Data Transfer Byte Definitions

Symbol	Definition	R/W (AS3675 Slave)	Note
S	Start Condition after Stop	R	1 bit
Sr	Repeated Start	R	1 bit
DW	Device Address for Write	R	10000000b (80h).
DR	Device Address for Read	R	10000001b (81h)
WA	Word Address	R	8 bits
A	Acknowledge	W	1 bit
N	Not Acknowledge	R	1 bit
reg_data	Register Data/Write	R	8 bits
data (n)	Register Data/read	R	1 bit
P	Stop Condition	R	8 bits
WA++	Increment Word Address Internally	R	During Acknowledge

Figure 36. Serial Interface Byte Write

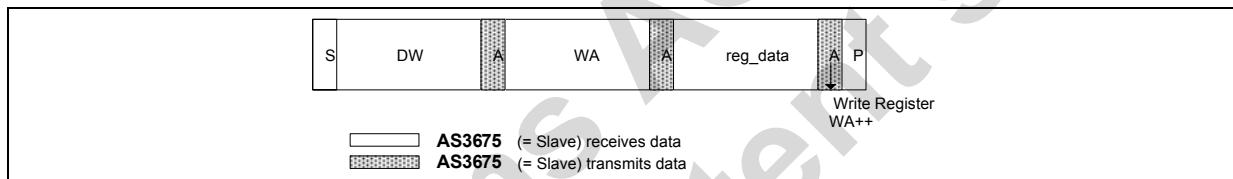

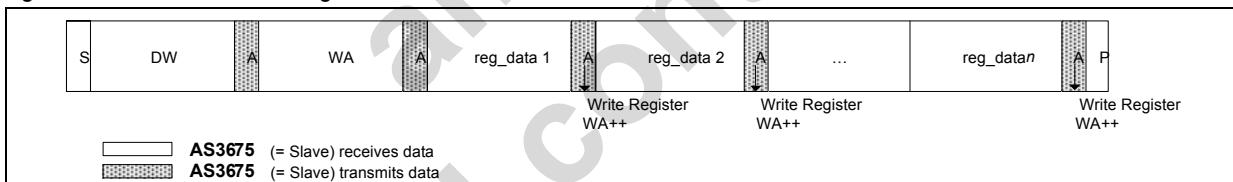

Figure 37. Serial Interface Page Write

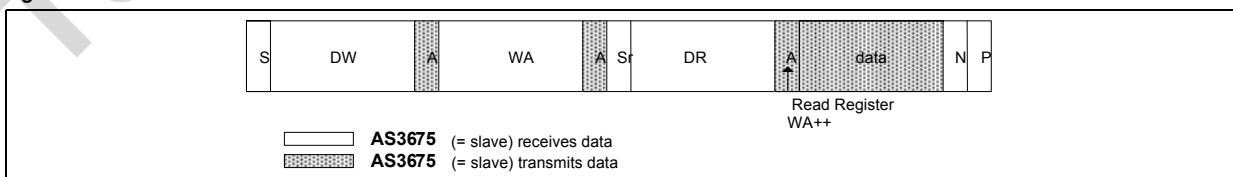

Byte Write and Page Write formats are used to write data to the slave.

The transmission begins with the START condition, which is generated by the master when the bus is in IDLE state (the bus is free). The device-write address is followed by the word address. After the word address any number of data bytes can be sent to the slave. The word address is incremented internally, in order to write subsequent data bytes on subsequent address locations.

For reading data from the slave device, the master has to change the transfer direction. This can be done either with a repeated START condition followed by the device-read address, or simply with a new transmission START followed by the device-read address, when the bus is in IDLE state. The device-read address is always followed by the 1st register byte transmitted from the slave. In Read Mode any number of subsequent register bytes can be read from the slave. The word address is incremented internally.

The following diagrams show the serial read formats supported by the AS3675.

Figure 38. Serial Interface Random Read

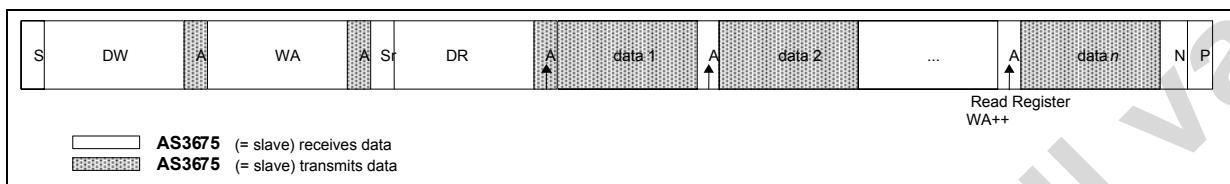

Random Read and Sequential Read are combined formats. The repeated START condition is used to change the direction after the data transfer from the master.

The word address transfer is initiated with a START condition issued by the master while the bus is idle. The START condition is followed by the device-write address and the word address.

In order to change the data direction a repeated START condition is issued on the 1st CLKpulse after the ACKNOWLEDGE bit of the word address transfer. After the reception of the device-read address, the slave becomes the transmitter. In this state the slave transmits register data located by the previous received word address vector. The master responds to the data byte with a NOT ACKNOWLEDGE, and issues a STOP condition on the bus.

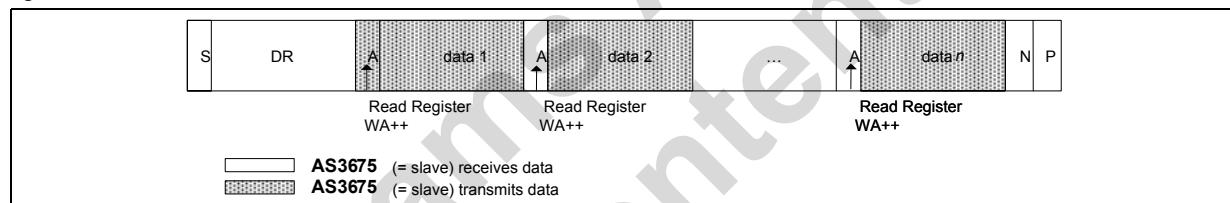

Figure 39. Serial Interface Sequential Read

Sequential Read is the extended form of Random Read, as multiple register-data bytes are subsequently transferred.

In contrast to the Random Read, in a sequential read the transferred register-data bytes are responded by an acknowledge from the master. The number of data bytes transferred in one sequence is unlimited (consider the behavior of the word-address counter). To terminate the transmission the master has to send a NOT ACKNOWLEDGE following the last data byte and subsequently generate the STOP condition.

Figure 40. Serial Interface Current Address Read

To keep the access time as small as possible, this format allows a read access without the word address transfer in advance to the data transfer. The bus is idle and the master issues a START condition followed by the Device-Read address.

Analogous to Random Read, a single byte transfer is terminated with a NOT ACKNOWLEDGE after the 1st register byte. Analogous to Sequential Read an unlimited number of data bytes can be transferred, where the data bytes must be responded to with an ACKNOWLEDGE from the master.

For termination of the transmission the master sends a NOT ACKNOWLEDGE following the last data byte and a subsequent STOP condition.

8.12 Operating Modes

If the voltage on CLK and DATA is less than 1V (for $> t_{POR_DEB}$), the AS3675 is in shutdown mode and its current consumption is minimized ($I_{BAT} = I_{SHUTDOWN}$) and all internal registers are reset to their default values.

If the voltage at CLK or DATA rises above 1V, the AS3675 serial interface is enabled and the AS3675 and the standby mode is selected. The AS3675 is switched automatically from standby mode ($I_{BAT} = I_{STANBY}$) into normal mode ($I_{BAT} = I_{ACTIVE}$) and back, if one of the following blocks are activated:

- Charge pump
- Step up regulator
- Any current sink
- ADC conversion started
- PWM active
- Pattern mode active.

If any of these blocks are already switched on the internal oscillator is running and a write instruction to the registers is directly evaluated within 1 internal CLK cycle (typ. 1 μ s)

If all these blocks are disabled, a write instruction to enable these blocks is delayed by 64 CLK cycles (oscillator will startup, within max 200µs).

Curr32 current	42h	00h	curr32_current											
Curr33 current	43h	00h	curr33_current											
Audio Control	46h	00h	audio_speed	freq_mo de	audio_color					aud_buf_on				

Table 94. Registermap

Register Definition	Addr	Default	Content												
			b7	b6	b5	b4	b3	b2	b1	b0					
Audio input	47h	00h	audio_di_s_start	audio_m_an_start	agc_ctrl			audio_gain							
Audio output	48h	00h		curr4x_a_ud_on	rgbx_aud_on	curr126_aud_on		aud_amplitude							
GPIO output 2	50h	00h	gpi_curr_43_en	gpi_curr_42_en	gpi_curr_41_en	gpi_rgb3_en	gpi_rgb2_en	gpi_rgb1_en	gpi_en	gpio_out					
GPIO signal 2	51h	00h	gpi_curr_43_in	gpi_curr_42_in	gpi_curr_41_in	gpi_rgb3_in	gpi_rgb2_in	gpi_rgb1_in	gpi_in	gpio_in					
Adder Current 4	52h	00h	adder_current4 (can be enabled for CURR33)												
CURR3x audio source	53h	00h	curr33_aud_src[1:0]	curr32_aud_src[1:0]	curr31_aud_src[1:0]	curr30_aud_src[1:0]									
Pattern End	54h	00h								pattern_end					
filt_type	70h	00h			filt3_type[1:0]	filt2_type[1:0]		filt1_type[1:0]							
filt1_A0_MSB	71h	00h	filt1_A0[11:8]												
filt1_A0_LSB	72h	00h	filt1_A0[7:0]												
filt1_a1_MSB	73h	00h	filt1_a1[11:8]												
filt1_a1_LSB	74h	00h	filt1_a1[7:0]												
filt1_a2_MSB	75h	00h	filt1_a2[11:8]												
filt1_a2_LSB	76h	00h	filt1_a2[7:0]												
filt2_A0_MSB	77h	00h	filt2_A0[11:8]												
filt2_A0_LSB	78h	00h	filt2_A0[7:0]												
filt2_a1_MSB	79h	00h	filt2_a1[11:8]												
filt2_a1_LSB	7ah	00h	filt2_a1[7:0]												
filt2_a2_MSB	7bh	00h	filt2_a2[11:8]												
filt2_a2_LSB	7ch	00h	filt2_a2[7:0]												
filt3_A0_MSB	7dh	00h	filt3_A0[11:8]												
filt3_A0_LSB	7eh	00h	filt3_A0[7:0]												
filt3_a1_MSB	7fh	00h	filt3_a1[11:8]												
filt3_a1_LSB	80h	00h	filt3_a1[7:0]												
filt3_a2_MSB	81h	00h	filt3_a2[11:8]												
filt3_a2_LSB	82h	00h	filt3_a2[7:0]												

Note: If writing to register, write 0 to unused bits

Write to read only bits will be ignored

yellow color = read only

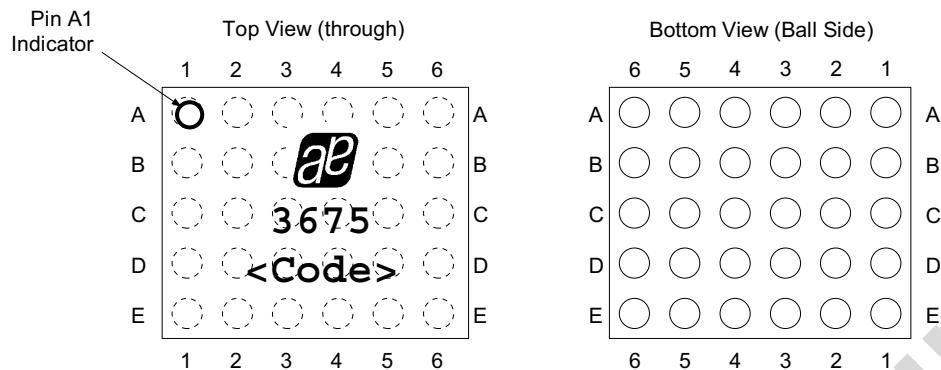

10 External Components

Table 95. External Components List

Part Number	Min	Value Typ	Max	tol. (min.)	Rating (max)	Notes	Package (min.)
C1		1µF		±20%	6.3V	Ceramic, X5R (V2_5 output) (e.g. Taiyo Yuden JMK105BJ105KV-F)	0402
C2		1µF		±20%	6.3V	Ceramic, X5R (VBAT) (e.g. Taiyo Yuden JMK105BJ105KV-F)	0402
C3		1µF		±20%	6.3V	Ceramic, X5R (Charge Pump) (e.g. Taiyo Yuden JMK105BJ105KV-F)	0402
C4		1µF		±20%	6.3V	Ceramic, X5R (Charge Pump) (e.g. Taiyo Yuden JMK105BJ105KV-F)	0402
C5		2.2µF		±20%	6.3V	Ceramic, X5R (Charge Pump Output) (e.g. Taiyo Yuden JMK107BJ225MA-T)	0403
C6		1µF		±20%	6.3V	Ceramic, X5R (Step Up DCDC input) (e.g. Taiyo Yuden JMK105BJ105KV-F)	0402
C7		1.5nF		±20%	25V	Ceramic, X5R (Step Up DCDC Feedback, 150pF for over voltage protection)	0402
C8		15nF		±20%	6.3V	Ceramic, X5R (Step Up DCDC Feedback, 1.5nF for over voltage protection)	0402
C9		4.7µF		±20%	25V	Ceramic, X5R, X7R (Step Up DCDC output) (e.g. Taiyo Yuden TMK316BJ475KG)	3.2x1.6x 1.25mm
C10		2.2µF		±20%	6.3V	Ceramic, X5R (Vana1 output) (e.g. Taiyo Yuden JMK107BJ225MA-T) only required if LDO is used	0403
R1		100mΩ		±5%		Shunt Resistor	0603
R2		1MΩ		±1%		Step Up DC/DC Converter Voltage Feedback	0201
R3		100kΩ		±1%		Step Up DC/DC Converter Voltage Feedback - not required for over voltage protection	0201
R4		1-10kΩ		±1%		DATA Pullup resistor – usually already inside master	0201
R5						CLKPullup resistor – usually already inside master	0201
L1		10µH		±20%		Recommended Type: Murata LQH3NPN100NJ0, Panasonic ELLSFG100MA or TDK VLF3012A	3x3x1.2mm
Q1 (+ D1)	FDFMA3N109					Integrated NMOS and Schottky diode	MicroFET 2x2mm
D2:D14	LED					As required by application

12 Ordering Information

The devices are available as the standard products shown in [Table 96](#).

Table 96. Ordering Information

Model	Description	Delivery Form	Package
AS3675-ZWLT	AS3675 Wafer Level Chip Scale Package, size 3x2.5mm, 6x5 balls, 0.5mm pitch, Pb-Free	Tape & Reel	30pin WL-CSP (3x2.5mm) RoHS compliant / Pb-Free

Note: AS3675-ZWLT

AS3675-

- Z Temperature Range: -30°C - 85°C
- WL Package: Wafer Level Chip Scale Package (WL-CSP) 3x2.5mm
- T Delivery Form: Tape & Reel

Disclaimer

Devices sold by austriamicrosystems AG are covered by the warranty and patent indemnification provisions appearing in its Term of Sale. austriamicrosystems AG makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. austriamicrosystems AG reserves the right to change specifications and prices at any time and without notice. Therefore, prior to designing this product into a system, it is necessary to check with austriamicrosystems AG for current information. This product is intended for use in normal commercial applications. Applications requiring extended temperature range, unusual environmental requirements, or high reliability applications, such as military, medical life-support or life-sustaining equipment are specifically not recommended without additional processing by austriamicrosystems AG for each application. For shipments of less than 100 parts the manufacturing flow might show deviations from the standard production flow, such as test flow or test location.

The information furnished here by austriamicrosystems AG is believed to be correct and accurate. However, austriamicrosystems AG shall not be liable to recipient or any third party for any damages, including but not limited to personal injury, property damage, loss of profits, loss of use, interruption of business or indirect, special, incidental or consequential damages, of any kind, in connection with or arising out of the furnishing, performance or use of the technical data herein. No obligation or liability to recipient or any third party shall arise or flow out of austriamicrosystems AG rendering of technical or other services.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
