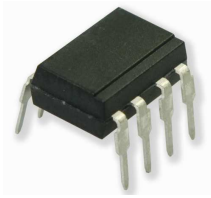
LTV-3120

2.5 Amp Output Current IGBT Gate Driver Optocoupler with Rail-to-Rail Output Voltage



Lead Free RoHS COMPLIANT

Description

The LTV-3120 optocoupler is ideally suited for driving power IGBTs and MOSFETs used in motor control inverter applications and inverters in power supply system. It contains a AlGaAs LED optically coupled to an integrated circuit with a power output stage. The 2.5A peak output current is capable of directly driving most IGBTs with ratings up to 1200 V/100 A. For IGBTs with higher ratings, the LTV-3120 series can be used to drive a discrete power stage which drives the IGBT gate.

The Optocoupler operational parameters are guaranteed over the temperature range from -40°C ~ +100°C.

Notice

Specifications of the products displayed herein are subject to change without notice.

The products shown in this publication are designed for the general use in electronic applications such as office automation equipment, communications devices, audio/visual equipment, electrical instrumentation and application. For equipment/devices where high reliability or safety is required, such as space applications, nuclear power control equipment, medical equipment, etc, please contact our sales representatives.

Immerge unit's body in solder paste is not recommended.

1) Maximum pulse width = 10us, maximum duty cycle = 0.2%.
2) Device is considered a two terminal device: pins 1, 2, 3 and 4 are shorted together and pins 5, 6, 7 and 8 are shorted together.
3) According to UL1577, each optocoupler is tested by applying an insulation test voltage ≥ 6000 Vrms for 1 second (leakage detection current limit, $I_{I-O} \leq 6$ uA).
4) The difference between T_{PHL} and T_{PLH} between any two LTV-3120 parts under same test conditions.
5) Common mode transient immunity in high stage is the maximum tolerable negative dVcm/dt on the trailing edge of the common mode impulse signal, Vcm, to assure that the output will remain high.
6) Common mode transient immunity in low stage is the maximum tolerable positive dVcm/dt on the leading edge of the common mode impulse signal, Vcm, to assure that the output will remain low.
7) Pulse Width Distortion is defined as $|T_{PHL} - T_{PLH}|$ for any given device.
8) At least a 0.1μF or bigger bypass capacitor must be connected/ closed across pin 8 and pin 5. Failure to provide the bypass may impair the switching property. Normally, it is recommended to place a 1μF multi-layer ceramic capacitor. To parallel one larger capacitor (>1μF) to optimize performance is better.
9) 260^{o}C for 10 seconds. Refer to Lead Free Reflow Profile
10) Derating Linearly above 70^{o}C free-air temperature at a rate of 0.47mW/^{o}C
11) Derating Linearly above 70^{o}C free-air temperature at a rate of 4.8mW/^{o}C
