MAX16150

nanoPower Pushbutton On/Off Controller and Battery Freshness Seal

General Description

The MAX16150A/MAX16150B are extremely low-power, pushbutton, on/off controllers with a switch debouncer and built-in latch. These devices accept a noisy input from a mechanical switch and produce a clean, latched output, as well as a one-shot interrupt output, in response to a switch closure exceeding the debounce period at PB_IN. The MAX16150A de-asserts the latched output when the switch closure period exceeds the shutdown period, while the MAX16150B does not de-assert the latched output in response to switch closure. For the MAX16150B, a longer switch closure results in a longer interrupt signal.

The MAX16150A/MAX16150B operate from a supply range of +1.3V to +5.5V and consume less than 20nA of supply current to ensure minimal battery drain in low-power applications, as well as to allow use as a battery "freshness seal". The robust switch input (PB_IN) accepts up to ±60V levels and is ±15kV ESD-protected for use in harsh environments. The latched output can serve as a logic signal to control a regulator, or it can serve as a switch to connect the load directly to the power supply when load current is low, providing 20mA of output current with less than 100mV voltage drop. A separate INT output provides a system interrupt whenever a valid pushbutton signal is detected. An asynchronous CLR input allows an external signal to force the latched output to the off state.

The MAX16150A and MAX16150B operate over the -40°C to +125°C temperature range are available in a 1mm x 1.5mm, 6-bump wafer-level package (WLP) and a 6-pin thin SOT-23 package.

Applications

- Portable Instruments
- Handheld Consumer Electronics
- Industrial Equipment
- Disposable Low-Power Electronics

Benefits and Features

- Low Power
 - · 20nA (Max) Standby Current
- · Debounces Noisy Switches
 - 50ms and 2s Debounce Timing Options
 - 8s and 16s Shutdown Timing Periods
- Latched Output Supplies 20mA Load Current With Less Than 100mV Drop
- One-Shot INT Output on Each Switch Closure
- 32ms INT Duration
- Pushbutton Input Handles Up to ±60V
- ±15kV HBM ESD Protection
- SOT23-6 and 1mm x 1.5mm, 6-bump WLPs

Ordering Information appears at end of data sheet.

Typical Application Circuit

Absolute Maximum Ratings

V _{CC} to GND0.3V to +6V	Operating Temperature Range	40°C to +125°C
PB_IN to GND60V to +60V	Junction Temperature	+150°C
CLR, INT, OUT to GND	Storage Temperature Range	40°C to +150°C
Continuous Power Dissipation (Multilayer Board) SOT23-6 (T _A =	Soldering Temperature (reflow)	+260°C
+70°C, derate 8.70mW/°C above +70°C.)696mW		
Continuous Power Dissipation (Multilayer Board) WLP (TA =		
+70°C, derate 10.50mW/°C above +70°C.)840mW		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Information

SOT23-6

Package Code	U6+1
Outline Number	21-0058
Land Pattern Number	<u>90-0175</u>
Thermal Resistance, Single Layer Board:	
Junction-to-Ambient (θ _{JA})	N/A
Junction-to-Case Thermal Resistance (θ _{JC})	80°C/W
Thermal Resistance, Four Layer Board:	·
Junction-to-Ambient (θ _{JA})	115°C/W
Junction-to-Case Thermal Resistance (θ _{JC})	80°C/W

WLP-6

Package Code	W60C1+2	
Outline Number	<u>21-100258</u>	
Land Pattern Number	Refer to Application Note 1891	
Thermal Resistance, Four-Layer Board:		
Junction-to-Ambient (θ _{JA})	95.15°C/W	
Junction-to-Case Thermal Resistance (θ _{JC})	N/A	

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Pin Configurations

SOT23-6

WLP-6

Pin Description

PIN		NAME	FUNCTION	
SOT23-6	WLP-6	NAME	FUNCTION	
1	А3	PB_IN	Pushbutton Input. $\overline{PB_IN}$ is internally pulled up to V_{CC} . Holding $\overline{PB_IN}$ low for a period greater than the debounce time (t_{DB}) forces OUT to latch high and generates a one-shot pulse at \overline{INT} . For the MAX16150A, holding $\overline{PB_IN}$ low for a period greater than the shutdown period (t_{SO}) de-asserts OUT. For the MAX16150B, holding $\overline{PB_IN}$ low for a period greater than shutdown period (t_{SO}) generates an extended interrupt pulse but does not de-assert OUT.	
2	A2	GND	Ground	
3	A1	V _{CC}	Power Supply Input. Bypass with a 0.1µF capacitor to ground.	
4	B1	OUT	Active-High, Push-Pull Latched Output. OUT is connected to V _{CC} when high.	
5	B2	ĪNT	Active-Low, Open-Drain Interrupt/Reset Output. $\overline{\text{INT}}$ is a one-shot output pulse. $\overline{\text{INT}}$ asserts for the interrupt timeout period when $\overline{\text{PB_IN}}$ is held low for a period greater than the debounce time (tDB). $\overline{\text{INT}}$ is high-impedance when de-asserted, even when pulled above VCC.	
6	ВЗ	CLR	Clear Input. Pulling CLR low de-asserts the latched OUT signal. If OUT is already de-asserted when CLR is pulled low, the state of OUT is unchanged.	

Block Diagram

Detailed Description

The MAX16150A/MAX16150B are pushbutton on/off controllers with a switch debouncer and latched output for controlling system power. A switch closure that pulls $\overline{PB_IN}$ low and is stable for a period greater than or equal to the debounce time (t_{DB}) causes OUT to assert high. Driving \overline{CLR} low causes OUT to de-assert. For the MAX16150A, a switch closure period greater than or equal to the shutdown period (t_{SO}) will cause OUT to de-assert. Each debounced switch closure also initiates a one-shot \overline{INT} output. See $\overline{Table~1}$ for details on the values of t_{DB} , t_{SO} , and other timing intervals.

Table 1. MAX16150A vs	5. MAX16150B IN	NPUT TIMING CI	HARACTERISTIC	;s

VERS	ION	DEBOUNCE TIME (t _{DB})	SHUTDOWN PERIOD (t _{SO})	INTERRUPT PERIOD (SWITCH CLOSURE > tDB)	INTERRUPT PERIOD (SWITCH CLOSURE > t _{SO})	SWITCH CLOSURE > tSO
MAX16	150A	50ms	8s	32ms	128ms	OUT De-asserts
MAX16	150B	2s	16s	32ms	128ms	OUT Stays Asserted

Operation

The MAX16150A/MAX16150B operate from supply voltages between +1.3V and +5.5V, consuming less than 20nA of supply current when OUT is in the de-asserted state and $\overline{PB_IN}$ is unconnected. Whenever OUT is de-asserted, the state of \overline{CLR} is ignored. After asserting OUT, \overline{CLR} continues to be ignored for a period of 2x the \overline{INT} period. For low-power applications (up to about 20mA output current), OUT can drive the load directly with minimal voltage drop. Each debounced switch closure causes \overline{INT} to assert. A switch closure longer than t_{SO} results in \overline{INT} asserting for a period that is 4x longer than the nominal \overline{INT} period. This longer \overline{INT} can be used to signal the system to perform a specific function, or to initiate a shutdown process. Closing the switch for a time longer than this extended \overline{INT} period will not cause \overline{INT} to be re-asserted or the \overline{INT} period to be extended.

The MAX16150A de-asserts OUT when $\overline{PB_IN}$ is held low for a period equal to or greater than the shutdown period, t_{SO} . Holding $\overline{PB_IN}$ of the MAX16150B low for a period equal to or greater than the shutdown period (t_{SO}) does not de-assert OUT. Instead the MAX16150B outputs a longer interrupt signal.

Note that, when V_{CC} is first applied (for example, when the battery is initially installed), OUT may initially be in either the asserted or the de-asserted state. To change the state, use either the PB_IN or CLR input as appropriate.

Very brief high periods (less than approximately 600µs) at $\overline{PB_IN}$ are ignored, so that fast switch bounces don't interrupt the debounce logic, while valid short presses and releases cause the debouncer to reset.

Figure 1. MAX16150A Timing Diagram

Figure 1 shows the timing diagram of the MAX16150A. A switch closure of a duration greater than t_{DB} causes OUT to

assert. A switch closure of a duration greater than t_{SO} causes OUT to de-assert. Typically, $\overline{\text{INT}}$ and $\overline{\text{CLR}}$ are pulled up either to OUT or to a regulated voltage controlled by OUT as depicted in $\overline{\text{Figure 1}}$. As such, $\overline{\text{INT}}$ and $\overline{\text{CLR}}$ are pulled low while OUT is de-asserted. If pulled up to a constant supply voltage, $\overline{\text{INT}}$ and $\overline{\text{CLR}}$ will behave as shown by the horizontal dashed lines while OUT is de-asserted.

Figure 2. MAX16150B Timing Diagram

Figure 2 shows the timing diagram for the MAX16150B. A switch closure of a duration greater than t_{DB} causes OUT to assert. A switch closure of a duration greater than t_{SO} does not cause OUT to de-assert. Instead, it causes an extended interrupt. Typically, \overline{INT} and \overline{CLR} are pulled up either to OUT or to a regulated voltage controlled by OUT as depicted in the figure above. As such, \overline{INT} and \overline{CLR} are pulled low while OUT is de-asserted. If pulled up to a constant supply voltage, \overline{INT} and \overline{CLR} will behave as shown by the horizontal dashed lines while OUT is de-asserted.

Robust Switch Input

The switch input (PB_IN) has overvoltage clamping diodes to protect against damaging fault conditions. Switch input voltages can safely swing ±60V relative to ground.

±15kV ESD Protection

ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The MAX16150A/MAX16150B have extra protection against static electricity to protect against ESD of ±15kV at the switch input without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. A design advantage of these devices is that they continue working without latchup after an ESD event, which eliminates the need to power-cycle the device. ESD protection can be tested in various ways; this product is characterized for protection to ±15kV using the Human Body Model.

Human Body Model

<u>Figure 3</u> shows the Human Body Model, while <u>Figure 4</u> shows the current waveform it generates when discharged into a low-impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a $1.5k\Omega$ resistor.

Figure 3. Human Body ESD Test Model

Figure 4. Human Body Current Waveform

Applications Information

Powering the Load

OUT is capable of driving light loads. When the supply current of circuitry is less than about 20mA, the voltage drop from V_{CC} to OUT is less than 100mV. The <u>Typical Application Circuit</u>, located at the beginning of this document, shows OUT providing power directly to the load.

Some systems require higher power supply current than the output of the MAX16150 can provide. For those cases, OUT can be used as an enable signal for the voltage regulator powering the system. This *Typical Application Circuit* shows an LDO providing power to the load. The LDO's enable input is driven by OUT. A debounced pushbutton at PB_IN of the MAX16150 causes OUT to assert high, thereby enabling the LDO.

Typical Application Circuit

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России, а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научноисследовательскими институтами России.

С нами вы становитесь еще успешнее!
