AVAILABLE

1.8V, Low-Power, 12-Bit, 170Msps ADC for Broadband Applications

General Description

The MAX1213N is a monolithic, 12-bit, 170Msps analog-to-digital converter (ADC) optimized for outstanding dynamic performance at high-IF frequencies beyond 300MHz. The product operates with conversion rates up to 170Msps while consuming only 720mW.

At 170Msps and an input frequency up to 100MHz, the MAX1213N achieves an 87dBc spurious-free dynamic range (SFDR) with excellent 67.2dB signal-to-noise ratio (SNR) that remains flat (within 2dB) for input tones up to 250MHz. This makes it ideal for wideband applications such as communications receivers, cable-head end receivers, and power-amplifier predistortion in cellular base-station transceivers.

The MAX1213N operates from a single 1.8V power supply. The analog input is designed for AC-coupled differential or single-ended operation. The ADC also features a selectable on-chip divide-by-2 clock circuit that accepts clock frequencies as high as 340MHz. A lowvoltage differential signal (LVDS) sampling clock is recommended for best performance. The converter provides LVDS-compatible digital outputs with data format selectable to be either two's complement or offset binary.

The MAX1213N is available in a 68-pin QFN package with exposed paddle (EP) and is specified over the industrial (-40°C to +85°C) temperature range.

See the *Pin-Compatible Versions* table for a complete selection of 8-bit, 10-bit, and 12-bit high-speed ADCs in this family.

Applications

Base-Station Power-Amplifier Linearization

Cable-Head End Receivers

Wireless and Wired Broadband Communications Communications Test Equipment

Radar and Satellite Subsystems

_Features

- 170Msps Conversion Rate
- ♦ Excellent Low-Noise Characteristics SNR = 67.2dB at f_{IN} = 100MHz SNR = 65.2dB at f_{IN} = 250MHz
- Excellent Dynamic Range
 SFDR = 87dBc at f_{IN} = 100MHz
 SFDR = 79dBc at f_{IN} = 250MHz
- Single 1.8V Supply
- 720mW Power Dissipation at f_{SAMPLE} = 170Msps and f_{IN} = 100MHz
- On-Chip Track-and-Hold Amplifier
- Internal 1.24V-Bandgap Reference
- ♦ On-Chip Selectable Divide-by-2 Clock Input
- LVDS Digital Outputs with Data Clock Output
- ♦ MAX1213NEVKIT Available

MAX1213N

Pin Description

PIN	NAME	FUNCTION					
1, 6, 11–14, 20, 25, 62, 63, 65	AV _{CC}	Analog Supply Voltage. Bypass AV _{CC} to AGND with a parallel combination of 0.1μ F and 0.22μ F capacitors for best decoupling results. Connect all AV _{CC} inputs together. See the <i>Grounding</i> , <i>Bypassing</i> , and <i>Board Layout Considerations</i> section.					
2, 5, 7, 10, 15, 16, 18, 19, 21, 24, 64, 66, 67	AGND	Analog Converter Ground. Connect all AGND inputs together.					
3	REFIO	Reference Input/Output. Pull REFADJ high to allow REFIO to accept an external reference. Pull REFADJ low to activate the internal 1.24V-bandgap reference. Connect a 0.1μ F capacitor from REFIO to AGND for both internal and external reference.					
4	REFADJ	Reference Adjust Input. REFADJ allows for FSR adjustments by placing a resistor or trim potentiometer between REFADJ and AGND (decreases FSR) or REFADJ and REFIO (increases FSR). Connect REFADJ to AV _{CC} to override the internal reference with an external source connected to REFIO. Connect REFADJ to AGND to allow the internal reference to determine the FSR of the data converter. See the <i>FSR Adjustment Using the Internal Bandgap Reference</i> section.					
8	INP	Positive Analog Input Terminal. Internally self-biased to 0.74V.					
9	INN	Negative Analog Input Terminal. Internally self-biased to 0.74V.					
17	CLKDIV	Clock Divider Input. CLKDIV controls the sampling frequency relative to the input clock frequency. CLKDIV has an internal pulldown resistor. CLKDIV = 0: Sampling frequency is at one-half the input clock frequency. CLKDIV = 1: Sampling frequency is equal to the input clock frequency.					
22	CLKP	True Clock Input. Apply an LVDS-compatible input level to CLKP. Internally self-biased to 1.15V.					
23 CLKN Complementary Clock Ir biased to 1.15V.		Complementary Clock Input. Apply an LVDS-compatible input level to CLKN. Internally self- biased to 1.15V.					
26, 45, 61	OGND	Digital Converter Ground. Ground connection for digital circuitry and output drivers. Connect all OGND inputs together.					
27, 28, 41, 44, 60	OV _{CC}	Digital Supply Voltage. Bypass OV_{CC} with a 0.1µF capacitor to OGND. Connect all OV_{CC} inputs together. See the <i>Grounding, Bypassing, and Board Layout Considerations</i> section.					
29	DON	Complementary Output Bit 0 (LSB)					
30	DOP	True Output Bit 0 (LSB)					
31	D1N	Complementary Output Bit 1					
32	D1P	True Output Bit 1					
33	D2N	Complementary Output Bit 2					
34	D2P	True Output Bit 2					
35	D3N	Complementary Output Bit 3					
36	D3P	True Output Bit 3					

Pin Description (continued)

PIN	NAME	FUNCTION				
37	D4N	Complementary Output Bit 4				
38	D4P	True Output Bit 4				
39	D5N	Complementary Output Bit 5				
40	D5P	True Output Bit 5				
42	DCLKN	Complementary Clock Output. This output provides an LVDS-compatible output level and car be used to synchronize external devices to the converter clock.				
43	DCLKP	True Clock Output. This output provides an LVDS-compatible output level and can be used to synchronize external devices to the converter clock.				
46	D6N	Complementary Output Bit 6				
47	D6P	True Output Bit 6				
48	D7N	Complementary Output Bit 7				
49	D7P	True Output Bit 7

55	D10P	True Output Bit 10				
56	D11N	Complementary Output Bit 11 (MSB)				
57	D11P	True Output Bit 11 (MSB)				
58	ORN	Complementary Out-of-Range Control Bit Output. If an out-of-range condition is detected, bit ORN flags this condition by transitioning low.				
59	ORP	True Out-of-Range Control Bit Output. If an out-of-range condition is detected, bit ORP flags this condition by transitioning high.				
68	₹/B	Output Format Select. This LVCMOS-compatible input controls the digital output format of the MAX1213N. \overline{T}/B has an internal pulldown resistor. $\overline{T}/B = 0$: Two's-complement output format. $\overline{T}/B = 1$: Binary output format.				
_	EP	Exposed Paddle. The exposed paddle is located on the backside of the chip and must be connected to AGND.				

Figure 1. Block Diagram

MAX1213N

Detailed Description— ____Theory of Operation

The MAX1213N uses a fully differential pipelined architecture that allows for high-speed conversion, optimized accuracy, and linearity while minimizing power consumption.

Both positive (INP) and negative/complementary analog input terminals (INN) are centered around a 0.74V common-mode voltage, and accept a differential analog input voltage swing of $\pm V_{FS}$ / 4 each, resulting in a typical 1.38VP-P differential full-scale signal swing. Inputs INP and INN are sampled when the differential sampling clock signal transitions high. When using the clock-

divide mode, the analog inputs are sampled at every other high transition of the differential sampling clock.

Each pipeline converter stage converts its input voltage to a digital output code. At every stage, except the last, the error between the input voltage and the digital output code is multiplied and passed along to the next pipeline stage. Digital error correction compensates for ADC comparator offsets in each pipeline stage and ensures no missing codes. The result is a 12-bit parallel digital output word in user-selectable two's-complement or offset binary output formats with LVDS-compatible output levels. See Figure 1 for a more detailed view of the MAX1213N architecture.

Analog Inputs (INP, INN)

INP and INN are the fully differential inputs of the MAX1213N. Differential inputs usually feature good rejection of even-order harmonics, which allows for enhanced AC performance as the signals are progressing through the analog stages. The MAX1213N analog inputs are self-biased at a 0.74V common-mode voltage

and allow a 1.38VP-p differential input voltage swing (Figure 2). Both inputs are self-biased through 900Ω resistors, resulting in a typical differential input resistance of $1.8k\Omega$. Drive the analog inputs of the MAX1213N in AC-coupled configuration to achieve the best dynamic performance. See the *Transformer-Coupled, Differential Analog Input Drive* section.

Figure 2. Simplified Analog Input Architecture and Allowable Input Voltage Range

MAX1213N

Figure 3. Simplified Reference Architecture

On-Chip Reference Circuit

The MAX1213N features an internal 1.24V-bandgap reference circuit (Figure 3), which, in combination with an internal reference-scaling amplifier, determines the FSR of the MAX1213N. Bypass REFIO with a 0.1 μ F capacitor to AGND. To compensate for gain errors or increase/decrease the ADC's FSR, the voltage of this bandgap reference can be indirectly adjusted by adding an external resistor (e.g., 100k Ω trim potentiometer) between REFADJ and AGND or REFADJ and REFIO. See the *Applications Information* section for a detailed description of this process.

To disable the internal reference, connect REFADJ to AV_{CC}. Apply an external, stable reference to set the converter's full scale. To enable the internal reference, connect REFADJ to AGND.

Clock Inputs (CLKP, CLKN)

Drive the clock inputs of the MAX1213N with an LVDSor LVPECL-compatible clock to achieve the best dynamic performance. The clock signal source must be of high quality and low phase noise to avoid any degradation in the noise performance of the ADC. The clock inputs (CLKP, CLKN) are internally biased to 1.15V and accept a typical 0.5VP-P differential signal swing (Figure 4). See the *Differential, AC-Coupled LVPECL-Compatible Clock Input* section for more circuit details on how to drive CLKP and CLKN appropriately. Although not recommended, the clock inputs also accept a single-ended input signal.

Figure 4. Simplified Clock Input Architecture

The MAX1213N also features an internal clock-management circuit (duty-cycle equalizer) that ensures the clock signal applied to inputs CLKP and CLKN is processed to provide a 50% duty-cycle clock signal that desensitizes the performance of the converter to variations in the duty cycle of the input clock source. Note that the clock duty-cycle equalizer cannot be turned off externally and requires a minimum 20MHz clock frequency to allow the device to meet data sheet specifications.

Data Clock Outputs (DCLKP, DCLKN)

The MAX1213N features a differential clock output, which can be used to latch the digital output data with an external latch or receiver. Additionally, the clock output can be used to synchronize external devices (e.g., FPGAs) to the ADC. DCLKP and DCLKN are differential outputs with LVDS-compatible voltage levels. There is a 4.58ns delay time between the rising (falling) edge of CLKP (CLKN) and the rising edge of DCLKP (DCLKN). See Figure 5 for timing details.

Divide-by-2 Clock Control (CLKDIV)

The MAX1213N offers a clock control line (CLKDIV), which supports the reduction of clock jitter in a system. Connect CLKDIV to OGND to enable the ADC's internal divide-by-2 clock divider. Data is now updated at one-half the ADC's input clock rate. CLKDIV has an internal pulldown resistor and can be left open for applications that require this divide-by-2 mode. Connecting CLKDIV to OV_{CC} disables the divide-by-2 mode.

System Timing Requirements

Figure 5 shows the relationship between the clock input and output, analog input, sampling event, and data output. The MAX1213N samples on the rising (falling) edge of CLKP (CLKN). Output data is valid on the next rising (falling) edge of the DCLKP (DCLKN) clock, but has an internal latency of 11 clock cycles.

Digital Outputs (D0P/N–D11P/N, DCLKP/N, ORP/N) and Control Input T/B

Digital outputs D0P/N–D11P/N, DCLKP/N, and ORP/N are LVDS compatible, and data on D0P/N–D11P/N is presented in either binary or two's-complement format (Table 1). The T/B control line is an LVCMOS-compatible input, which allows the user to select the desired output format. Pulling T/B low outputs data in two's complement and pulling it high presents data in offset binary format on the 12-bit parallel bus. T/B has an internal pulldown resistor and may be left unconnected in applications using only two's-complement output format. All LVDS outputs provide a typical 0.325V voltage swing around a 1.2V common-mode voltage, and must be terminated at the far end of each transmission line pair (true and complementary) with 100 Ω . Apply a 1.7V to 1.9V voltage supply at OV_{CC} to power the LVDS outputs.

The MAX1213N offers an additional differential output pair (ORP, ORN) to flag out-of-range conditions, where out-of-range is above positive or below negative full scale. An out-of-range condition is identified with ORP (ORN) transitioning high (low).

Note: Although a differential LVDS output architecture reduces single-ended transients to the supply and ground planes, capacitive loading on the digital outputs should still be kept as low as possible. Using LVDS buffers on the digital outputs of the ADC when driving larger loads may improve overall performance and reduce system-timing constraints.

INP ANALOG INPUT VOLTAGE LEVEL	INN ANALOG INPUT VOLTAGE LEVEL	OUT-OF-RANGE ORP (ORN)	BINARY DIGITAL OUTPUT CODE (D11P/N–D0P/N)	TWO'S-COMPLEMENT DIGITAL OUTPUT CODE (D11P/N-D0P/N)

Table 1. MAX1213N Digital Output Coding

Applications Information

FSR Adjustments Using the Internal **Bandgap Reference**

The MAX1213N supports a 10% (±5%) full-scale adjustment range. To decrease the full-scale signal range, add an external resistor value ranging from $13k\Omega$ to $1M\Omega$ between REFADJ and AGND. Adding a variable resistor, potentiometer, or predetermined resistor value between REFADJ and REFIO increases the FSR of the data converter. Figure 6a shows the two possible configurations and their impact on the overall full-scale range adjustment of the MAX1213N. Do not use resistor values of less than $13k\Omega$ to avoid instability of the internal gain regulation loop for the bandgap reference. See Figure 6b for the resulting FSR for a series of resistor values.

Figure 6a. Circuit Suggestions to Adjust the ADC's Full-Scale Range

Figure 6b. FS Adjustment Range vs. FS Adjustment Resistor

Differential, AC-Coupled, LVPECL-Compatible Clock Input

The MAX1213N dynamic performance depends on the use of a very clean clock source. The phase noise floor of the clock source has a negative impact on the SNR performance. Spurious signals on the clock signal source also affect the ADC's dynamic range. The preferred method of clocking the MAX1213N is differentially with LVDS- or LVPECL-compatible input levels. The fast data transition rates of these logic families minimize the clock-input circuitry's transition uncertainty, thereby improving the SNR performance. To accomplish this, a 50 Ω reverse-terminated clock signal source with low phase noise is AC-coupled into a fast differential receiver such as the MC100LVEL16 (Figure 7). The receiver produces the necessary LVPECL output levels to drive the clock inputs of the data converter.

Figure 7. Differential, AC-Coupled, PECL-Compatible Clock Input Configuration

Transformer-Coupled, Differential Analog Input Drive

The MAX1213N provides the best SFDR and THD with fully differential input signals and it is not recommended to drive the ADC inputs in single-ended configuration. In differential input mode, even-order harmonics are usually lower since INP and INN are balanced, and each of the ADC inputs only requires half the signal swing compared to a single-ended configuration.

Wideband RF transformers provide an excellent solution to convert a single-ended signal to a fully differential signal, required by the MAX1213N to reach its optimum dynamic performance. Apply a secondary-side termination of a 1:1 transformer (e.g., Mini-Circuit's ADT1-1WT) into two separate 24.9 Ω resistors. Higher source impedance values can be used at the expense of degradation in dynamic performance. This configuration optimizes THD and SFDR performance of the ADC by reducing the effects of transformer parasitics.

However, the source impedance combined with the shunt capacitance provided by a PC board and the ADC's parasitic capacitance limit the ADC's full-power input bandwidth.

To further enhance THD and SFDR performance at high input frequencies (> 100MHz), a second transformer (Figure 8) should be placed in series with the singleended-to-differential conversion transformer. This transformer reduces the increase of even-order harmonics at high frequencies.

Single-Ended, AC-Coupled Analog Inputs Although not recommended, the MAX1213N can be used in single-ended mode (Figure 9). AC-couple the analog signals to the positive input INP through a 0.1µF capacitor terminated with a 49.9Ω resistor to AGND. Terminate the negative input INN with a 49.9Ω resistor in series with a 0.1µF capacitor to AGND. In single-ended mode, the input range is limited to approximately half of the FSR of the device, and dynamic performance usually degrades.

Grounding, Bypassing, and Board Layout Considerations

The MAX1213N requires board-layout design techniques suitable for high-speed data converters. This ADC provides separate analog and digital power supplies. The analog and digital supply voltage pins accept 1.7V to 1.9V input voltage ranges. Although both supply types can be combined and supplied from one source, it is recommended to use separate sources to cut down on performance degradation caused by digital switching currents, which can couple into the analog supply network. Isolate analog and digital supplies (AV_{CC} and OV_{CC}) where they enter the PC board with separate networks of ferrite beads and capacitors to their corresponding grounds (AGND, OGND).

To achieve optimum performance, provide each supply with a separate network of a 47μ F tantalum capacitor and parallel combinations of 10μ F and 1μ F ceramic capacitors. Additionally, the ADC requires each supply pin to be bypassed with separate 0.1μ F ceramic capacitors (Figure 10). Locate these capacitors directly at the ADC supply pins or as close as possible to the MAX1213N. Choose surface-mount capacitors, whose preferred location should be on the same side as the converter to save space and minimize the inductance. If close placement on the same side is not possible, these bypassing capacitors may be routed through vias to the bottom side of the PC board.

Multilayer boards with separated ground and power planes produce the highest level of signal integrity. Consider the use of a split ground plane arranged to match the physical location of analog and digital ground on the ADC's package. The two ground planes should be joined at a single point so the noisy digital ground currents do not interfere with the analog ground plane. The dynamic currents that may need to travel long distances before they are recombined at a common source ground, resulting in large and undesirable ground loops, are a major concern with this approach. Ground loops can degrade the input noise by coupling back to the analog front-end of the converter, resulting in increased spurious activity, leading to decreased noise performance.

Alternatively, all ground pins could share the same ground plane, if the ground plane is sufficiently isolated from any noisy, digital systems ground. To minimize the coupling of the digital output signals from the analog input, segregate the digital output bus carefully from the analog input circuitry. To further minimize the effects of digital noise coupling, ground return vias can be positioned throughout the layout to divert digital switching currents away from the sensitive analog sections of the ADC. This approach does not require split ground planes, but can be accomplished by placing substantial ground connections between the analog front-end and the digital outputs.

Figure 10. Grounding, Bypassing, and Decoupling Recommendations for the MAX1213N

MAX1213N

The MAX1213N is packaged in a 68-pin QFN-EP package (package code: G6800-4), providing greater design flexibility, increased thermal dissipation, and optimized AC performance of the ADC. The exposed paddle (EP) must be soldered down to AGND.

In this package, the data converter die is attached to an EP lead frame with the back of this frame exposed at the package bottom surface, facing the PC board side of the package. This allows a solid attachment of the package to the board with standard infrared (IR) flow soldering techniques.

Thermal efficiency is one of the factors for selecting a package with an exposed paddle for the MAX1213N. The exposed paddle improves thermal and ensures a solid ground connection between the ADC and the PC board's analog ground layer.

Considerable care must be taken when routing the digital output traces for a high-speed, high-resolution data converter. Keep trace lengths at a minimum and place minimal capacitive loading (less than 5pF) on any digital trace to prevent coupling to sensitive analog sections of the ADC. It is recommended running the LVDS output traces as differential lines with 100Ω matched impedance from the ADC to the LVDS load device.

Static Parameter Definitions

Integral Nonlinearity (INL)

Integral nonlinearity is the deviation of the values on an actual transfer function from a straight line. This straight line can be either a best straight-line fit or a line drawn between the end points of the transfer function, once offset and gain errors have been nullified. The static linearity parameters for the MAX1213N are measured using the histogram method with a 10MHz input frequency.

Differential Nonlinearity (DNL)

Differential nonlinearity is the difference between an actual step width and the ideal value of 1 LSB. A DNL error specification of less than 1 LSB guarantees no missing codes and a monotonic transfer function. The MAX1213N's DNL specification is measured with the histogram method based on a 10MHz input tone.

Dynamic Parameter Definitions

Aperture Jitter

Figure 11 shows the aperture jitter (t_{AJ}) , which is the sample-to-sample variation in the aperture delay.

Aperture Delay

Aperture delay (t_{AD}) is the time defined between the rising edge of the sampling clock and the instant when an actual sample is taken (Figure 11).

Signal-to-Noise Ratio (SNR)

For a waveform perfectly reconstructed from digital samples, the theoretical maximum SNR is the ratio of the fullscale analog input (RMS value) to the RMS quantization error (residual error). The ideal, theoretical minimum analog-to-digital noise is caused by quantization error only and results directly from the ADC's resolution (N bits):

$SNR[max] = 6.02 \times N + 1.76$

In reality, other noise sources such as thermal noise, clock jitter, signal phase noise, and transfer function nonlinearities also contribute to the SNR calculation and should be considered when determining the signal-to-noise ratio in ADC. The SNR for the MAX1213N is specified in decibels (dB), however, SNR can also be specified in dBFS. To obtain the SNR in dBFS, simply subtract the amplitude of the input tone (this number is given in dBFS) at which the SNR is measured from the SNR number in dB. For example, an ADC having an SNR of 67dB resulting from an input tone with amplitude -1dBFS will have an SNR of 67 - (-1) = 68dBFS.

Signal-to-Noise Plus Distortion (SINAD)

SINAD is computed by taking the ratio of the RMS signal to all spectral components excluding the fundamental and the DC offset. In the case of the MAX1213N, SINAD is computed from a curve fit.

Figure 11. Aperture Jitter/Delay Specifications

Spurious-Free Dynamic Range (SFDR)

SFDR is the ratio of the RMS amplitude of the carrier frequency (maximum signal component) to the RMS value of the next-largest noise or harmonic distortion component. SFDR is usually measured in dBc with respect to the carrier frequency amplitude or in dBFS with respect to the ADC's full-scale range.

Intermodulation Distortion (IMD)

IMD is the ratio of the RMS sum of the intermodulation products to the RMS sum of the two fundamental input tones. This is expressed as:

$$\mathsf{IMD} = 20 \times \mathsf{log}\left(\frac{\sqrt{\mathsf{V_{IM1}}^2 + \mathsf{V_{IM2}}^2 + \dots + \mathsf{V_{IM3}}^2 + \mathsf{V_{IMn}}^2}}{\sqrt{\mathsf{V_1}^2 + \mathsf{V_2}^2}}\right)$$

The fundamental input tone amplitudes (V_1 and V_2) are at -7dBFS. The intermodulation products are the amplitudes of the output spectrum at the following frequencies:

- Second-order intermodulation products: $f_{IN1} + f_{IN2}$, $f_{IN2} f_{IN1}$
- Third-order intermodulation products: $2 \times f_{IN1} f_{IN2}$, $2 \times f_{IN2} - f_{IN1}$, $2 \times f_{IN1} + f_{IN2}$, $2 \times f_{IN2} + f_{IN1}$
- Fourth-order intermodulation products: $3 \times f_{IN1} f_{IN2}$, $3 \times f_{IN2} - f_{IN1}$, $3 \times f_{IN1} + f_{IN2}$, $3 \times f_{IN2} + f_{IN1}$
- Fifth-order intermodulation products: $3 \times f_{IN1} 2 \times f_{IN2}$, $3 \times f_{IN2} - 2 \times f_{IN1}$, $3 \times f_{IN1} + 2 \times f_{IN2}$, $3 \times f_{IN2} + 2 \times f_{IN1}$

Full-Power Bandwidth

A large -1dBFS analog input signal is applied to an ADC and the input frequency is swept up to the point where the amplitude of the digitized conversion result has decreased by 3dB. The -3dB point is defined as the full-power input bandwidth frequency of the ADC.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию.

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России, а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научноисследовательскими институтами России.

С нами вы становитесь еще успешнее!
