## Description

The MAMG-000912-090PSM is a 2-stage GaN power module in a “True SMT” laminate package. The module is fully matched. Under pulsed conditions, it can deliver output power greater than 90 W, with 30 dB typical associated gain and 60% typical power added efficiency.

Flexible design allows for gate and/or drain pulsing. Additional features include a gate voltage sense port for use in temperature compensation or pulse droop compensation. The overall package size is very small, only 14x24 mm<sup>2</sup>. The module’s compact size, combined with excellent RF performance makes this product an ideal solution for pulsed RADAR applications where small size, light weight and performance (SWaP) are the key.

9. Exceeding any one or combination of these limits may cause permanent damage to this device.

10. MACOM does not recommend sustained operation near these survivability limits.

11. For saturated performance it is recommended that the sum of  $(3 * V_{DD} + \text{abs}(V_{GG})) \leq 175 \text{ V}$ .

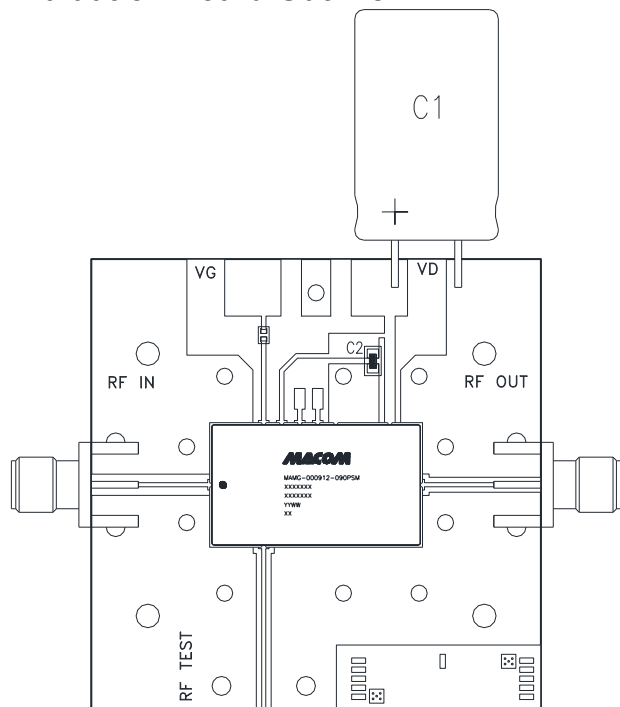

12. CW operation is not recommended.

13. Operating at nominal conditions with T<sub>J</sub> ≤ 200°C will ensure MTTF > 1 x 10<sup>6</sup> hours. Junction temperature directly affects device MTTF and should be kept as low as possible to maximize lifetime.

14. Junction Temperature (T<sub>J</sub>) = T<sub>C</sub> + Θ<sub>JC</sub> \* ((V \* I) - (P<sub>OUT</sub> - P<sub>IN</sub>)).

Typical Transient Thermal Resistance Θ<sub>JC</sub> = 1.6 °C/W (50V, 600 μs pulses, 10% duty cycle)

## Evaluation Board Outline

## Parts List

Part	Value	Case Style
C1	100 $\mu$ F	Radial
C2	10 nF	0603

Parts are measured and sampled in the evaluation board shown on the left. The board is made of 8-mil thick RO4003C and is bolted onto a Ni-plated Aluminum plate. Electrical and thermal ground is provided using a Cu-filled via-hole array (pictured below). Very few external components are used, as DC blocks are not required.

## Bias Sequencing
