
LIN Bus Transceiver with Integrated Voltage Regulator

DATASHEET

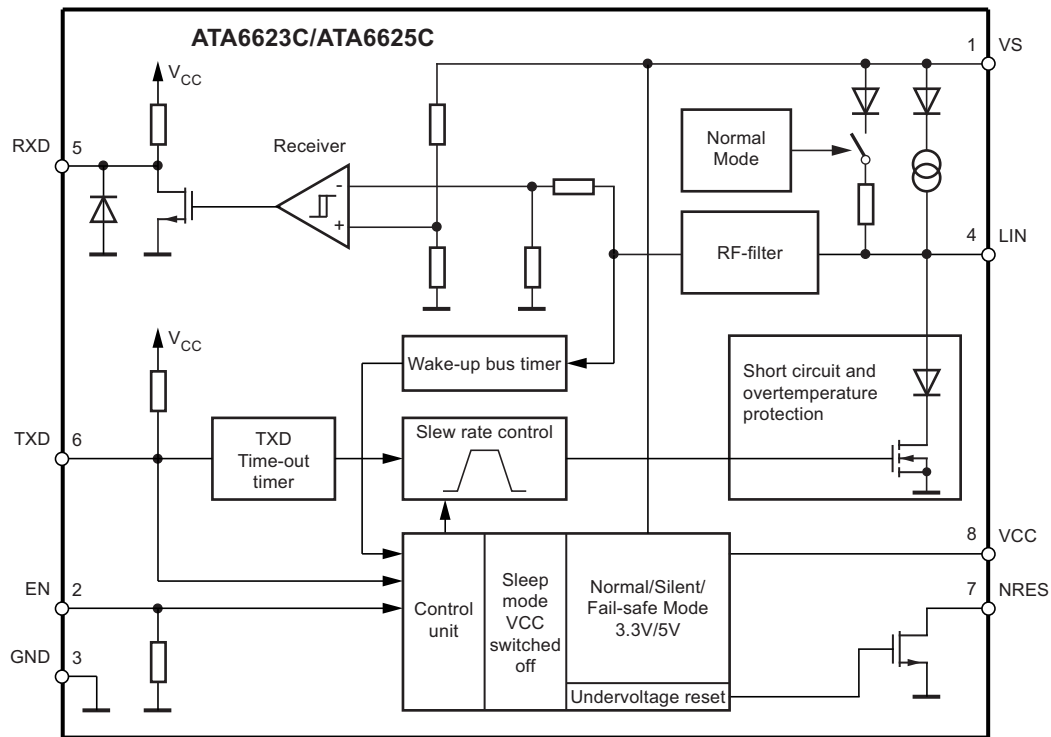

Features

- Supply voltage up to 40V
- Operating voltage $V_S = 5V$ to 27V
- Typically 10 μ A supply current during sleep mode
- Typically 57 μ A Supply current in silent mode
- Linear low-drop voltage regulator, 85mA current capability:
 - Normal, fail-safe, and silent mode
 - Atmel[®] ATA6623C: $V_{CC} = 3.3V \pm 2\%$
 - Atmel ATA6625C: $V_{CC} = 5.0V \pm 2\%$
 - Sleep mode: V_{CC} is switched off
- V_{CC} undervoltage detection with reset open drain output NRES (4ms reset time)
- Voltage regulator is short-circuit and over-temperature protected
- LIN physical layer according to LIN 2.0, 2.1 and SAEJ2602-2
- Wake-up capability via LIN bus (90 μ s dominant)
- TXD time-out timer
- Bus pin is overtemperature and short-circuit protected versus GND and battery
- Advanced EMC and ESD performance
- Fulfills the OEM “Hardware Requirements for LIN in Automotive Applications Rev1.0”
- Interference and damage protection according to ISO7637
- Package: SO8

1. Description

The Atmel® ATA6623C/ATA6625C is a fully integrated LIN transceiver, designed according to the LIN specification 2.0 and 2.1, with a low-drop voltage regulator (3.3V/5V/85mA). The combination of voltage regulator and bus transceiver makes it possible to develop simple, but powerful, slave nodes in LIN Bus systems. The Atmel ATA6623C/ATA6625C is designed to handle the low-speed data communication in vehicles (for example, in convenience electronics). Improved slope control at the LIN driver ensures secure data communication up to 20kBaud with an RC oscillator for the protocol handling. The bus output is designed to withstand high voltage. Sleep mode (voltage regulator switched off) and silent mode (communication off; V_{CC} voltage on) guarantee minimized current consumption.

Figure 1-1. Block Diagram

2. Pin Configuration

Figure 2-1. Pinning SO8

Table 2-1. Pin Description

| Pin | Symbol | Function |
|-----|--------|--|
| 1 | VS | Battery supply |
| 2 | EN | Enables normal mode if the input is high |
| 3 | GND | Ground, heat sink |
| 4 | LIN | LIN bus line input/output |
| 5 | RXD | Receive data output |
| 6 | TXD | Transmit data input |
| 7 | NRES | Output undervoltage reset, low at reset |
| 8 | VCC | Output voltage regulator 3.3V/5V/85mA |

3. Functional Description

3.1 Physical Layer Compatibility

Since the LIN physical layer is independent from higher LIN layers (e.g., LIN protocol layer), all nodes with a LIN physical layer according to revision 2.x can be mixed with LIN physical layer nodes, which are according to older versions (i.e., LIN 1.0, LIN 1.1, LIN 1.2, LIN 1.3) without any restrictions.

3.2 Supply Pin (VS)

LIN operating voltage is $V_S = 5V$ to $27V$. An undervoltage detection is implemented to disable transmission if V_S falls below $5V$, in order to avoid false bus messages. After switching on V_S , the IC starts with the fail-safe mode and the voltage regulator is switched on.

The supply current in sleep mode is typically $10\mu A$ and $57\mu A$ in silent mode.

3.3 Ground Pin (GND)

The IC does not affect the LIN Bus in the event of GND disconnection. It is able to handle a ground shift up to 11.5% of V_S .

3.4 Voltage Regulator Output Pin (VCC)

The internal 3.3V/5V voltage regulator is capable of driving loads up to $85mA$, supplying the microcontroller and other ICs on the PCB and is protected against overload by means of current limitation and overtemperature shut-down. Furthermore, the output voltage is monitored and will cause a reset signal at the NRES output pin if it drops below a defined threshold V_{thun} .

3.5 Undervoltage Reset Output (NRES)

If the V_{CC} voltage falls below the undervoltage detection threshold of V_{thun} , NRES switches to low after t_{res_f} (Figure 6-1 on page 11). Even if $V_{CC} = 0V$ the NRES stays low, because it is internally driven from the V_S voltage. If V_S voltage ramps down, NRES stays low until $V_S < 1.5V$ and then becomes highly resistant.

The implemented undervoltage delay keeps NRES low for $t_{Reset} = 4ms$ after V_{CC} reaches its nominal value.

3.6 Bus Pin (LIN)

A low-side driver with internal current limitation and thermal shutdown as well as an internal pull-up resistor according to LIN specification 2.x is implemented. The voltage range is from $-27V$ to $+40V$. This pin exhibits no reverse current from the LIN bus to V_S , even in the event of a GND shift or V_{Batt} disconnection. The LIN receiver thresholds are compatible with the LIN protocol specification.

The fall time (from recessive to dominant) and the rise time (from dominant to recessive) are slope controlled.

3.7 Input Pin (TXD)

In normal mode the TXD pin is the microcontroller interface to control the state of the LIN output. TXD must be pulled to ground in order to drive the LIN bus low. If TXD is high or unconnected (internal pull-up resistor), the LIN output transistor is turned off and the bus is in the recessive state.

3.8 Dominant Time-out Function (TXD)

The TXD input has an internal pull-up resistor. An internal timer prevents the bus line from being driven permanently in the dominant state. If TXD is forced to low longer than $t_{dom} > 6ms$, the LIN bus driver is switched to the recessive state.

To reactivate the LIN bus driver, switch TXD to high ($> 10\mu s$).

3.9 Output Pin (RXD)

This output pin reports the state of the LIN-bus to the microcontroller. LIN high (recessive state) is reported by a high level at RXD; LIN low (dominant state) is reported by a low level at RXD. The output has an internal pull-up resistor with typically $5k\Omega$ to V_{CC} . The AC characteristics are measured with an external load capacitor of $20pF$.

The output is short-circuit protected. In unpowered mode (that is, $V_S = 0V$), RXD is switched off.

3.10 Enable Input Pin (EN)

The Enable Input pin controls the operation mode of the device. If EN is high, the circuit is in normal mode, with transmission paths from TXD to LIN and from LIN to RXD both active. The VCC voltage regulator operates with 3.3V/5V/85mA output capability.

If EN is switched to low while TXD is still high, the device is forced to silent mode. No data transmission is then possible, and the current consumption is reduced to I_{VS} typ. 57µA. The VCC regulator has its full functionality.

If EN is switched to low while TXD is low, the device is forced to sleep mode. No data transmission is possible, and the voltage regulator is switched off.

4. Modes of Operation

Figure 4-1. Modes of Operation

Table 4-1. Modes of Operation

| Mode of Operation | Transceiver | V _{CC} | RXD | LIN |
|-------------------|-------------|-----------------|-------------------------------|---------------|
| Fail safe | OFF | 3.3V/5V | High, Except after wake-up | Recessive |
| Normal | ON | 3.3V/5V | LIN depending | TXD depending |
| Silent | OFF | 3.3V/5V | High | Recessive |
| Sleep | OFF | 0V | 0V | Recessive |

4.1 Normal Mode

This is the normal transmitting and receiving mode of the LIN Interface, in accordance with LIN specification 2.x. The V_{CC} voltage regulator operates with a 3.3V/5V output voltage, with a low tolerance of $\pm 2\%$ and a maximum output current of 85mA.

If an undervoltage condition occurs, NRES is switched to low and the IC changes its state to fail-safe mode.

4.2 Silent Mode

A falling edge at EN while TXD is high switches the IC into silent mode. The TXD Signal has to be logic high during the mode select window (Figure 4-2 on page 6). The transmission path is disabled in silent mode. The overall supply current from V_{Batt} is a combination of the $I_{VSSi} = 57\mu A$ plus the V_{CC} regulator output current I_{VCC} .

In silent mode the internal slave termination between pin LIN and pin VS is disabled, and only a weak pull-up current (typically $10\mu A$) between pin LIN and pin VS is present. The silent mode can be activated independently from the current level on pin LIN.

If an undervoltage condition occurs, NRES is switched to low and the IC changes its state to fail-safe mode.

A voltage less than the LIN Pre-wake detection V_{LINL} at pin LIN activates the internal LIN receiver and switches on the internal slave termination between the LIN pin and the VS pin.

A falling edge at the LIN pin followed by a dominant bus level maintained for a certain time period ($> t_{bus}$) and the following rising edge at pin LIN (see Figure 4-3 on page 7) results in a remote wake-up request.

The device switches from silent mode to fail-safe mode, and the remote wake-up request is indicated by a low level at pin RXD to interrupt the microcontroller (Figure 4-3 on page 7). EN high can be used to switch directly to normal mode.

Figure 4-2. Switch to Silent Mode

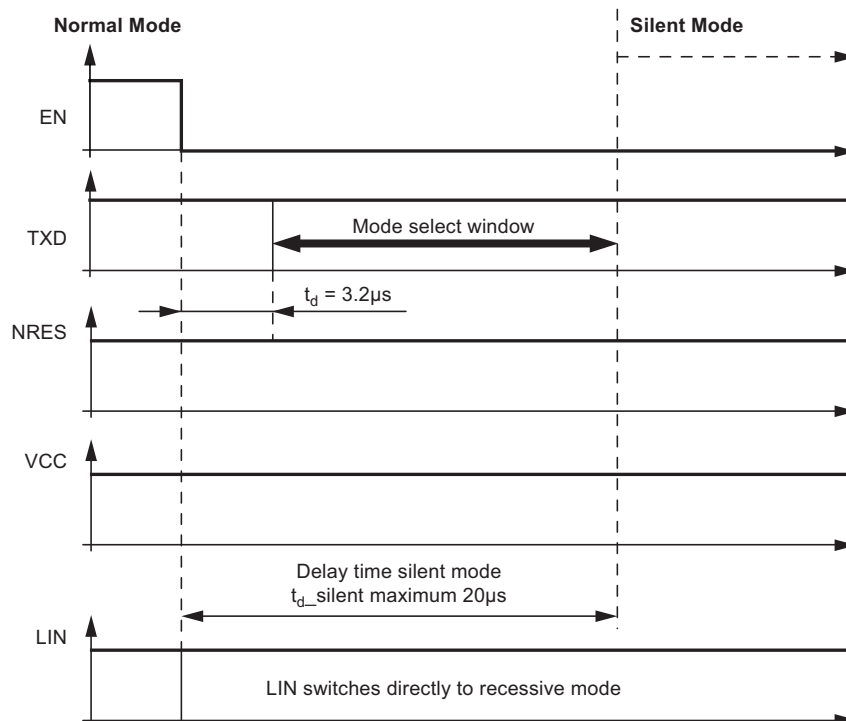

Figure 4-3. LIN Wake-up Waveform Diagram from Silent Mode

4.3 Sleep Mode

A falling edge at EN while TXD is low switches the IC into sleep mode. The TXD Signal has to be logic low during the mode select window (Figure 4-4 on page 8). To avoid influencing the LIN-pin during the switch to sleep mode, it is possible to switch the EN up to 3.2µs earlier to LOW than the TXD. Even if the two falling edges at TXD and EN occur at the same time, the LIN line will remain uninfluenced.

In sleep mode the transmission path is disabled. The supply current $I_{V_{SS}sleep}$ from V_{Batt} is typically 10µA. The V_{CC} regulator is switched off, NRES and RXD are low. The internal slave termination between pin LIN and pin VS is disabled, only a weak pull-up current (typically 10µA) between pin LIN and pin VS is present. sleep mode can be activated independently from the current level on pin LIN.

A voltage less than the LIN Pre-wake detection V_{LINL} at pin LIN activates the internal LIN receiver and switches on the internal slave termination between the LIN pin and the VS pin.

A falling edge at the LIN pin followed by a dominant bus level maintained for a certain time period ($> t_{bus}$) and a following rising edge at pin LIN results in a remote wake-up request. The device switches from sleep mode to fail-safe mode.

The V_{CC} regulator is activated, and the remote wake-up request is indicated by a low level at the RXD pin to interrupt the microcontroller (Figure 4-5 on page 9).

EN high can be used to switch directly from sleep to fail-safe mode. If EN is still high after VCC ramp up and undervoltage reset time, the IC switches to normal mode.

Figure 4-4. Switch to Sleep Mode

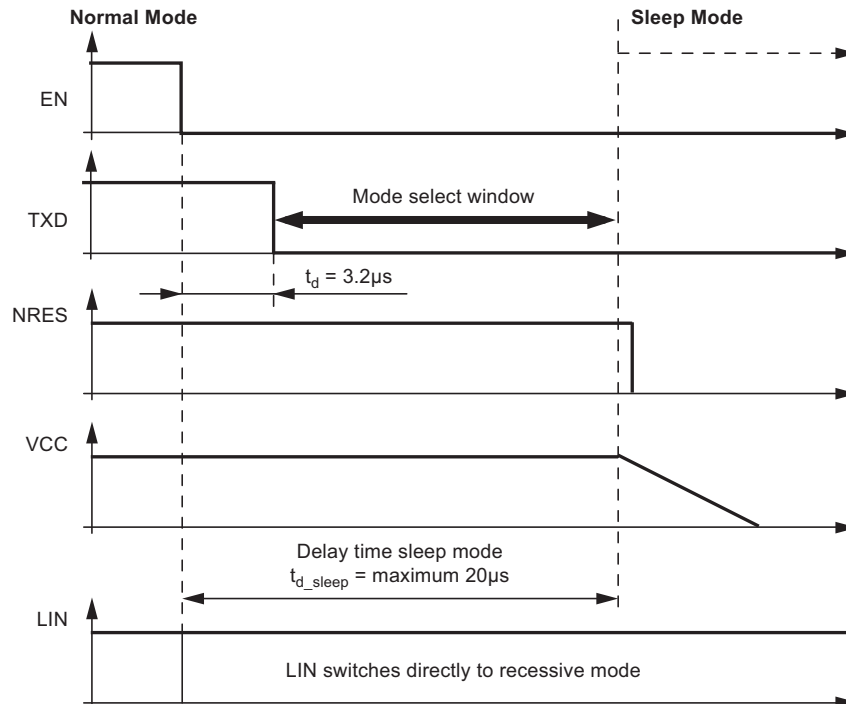

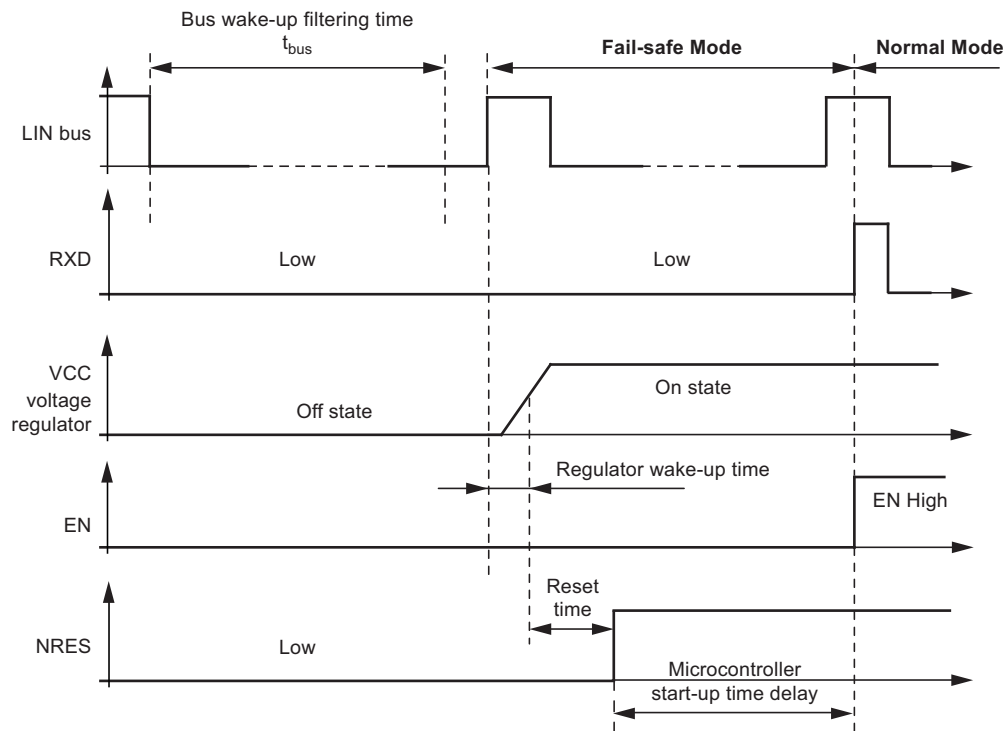

Figure 4-5. LIN Wake-up Diagram from Sleep Mode

4.4 Fail-safe Mode

At system power-up the device automatically switches to fail-safe mode. The voltage regulator is switched on (see [Figure 6-1 on page 11](#)). The NRES output switches to low for $t_{res} = 4\text{ms}$ and gives a reset to the microcontroller. LIN communication is switched off. The IC stays in this mode until EN is switched to high, and changes then to the normal mode. A power down of V_{Batt} ($V_S < 3.7\text{V}$) during silent or sleep mode switches the IC into the fail-safe mode after power up. A logic low at NRES switches the IC into fail-safe mode directly.

4.5 Unpowered Mode

If you connect battery voltage to the application circuit, the voltage at the VS pin increases according to the block capacitor (see [Figure 6-1 on page 11](#)). After VS is higher than the VS undervoltage threshold VS_{th} , the IC mode changes from unpowered mode to fail-safe mode. The VCC output voltage reaches its nominal value after t_{VCC} . This time, t_{VCC} , depends on the VCC capacitor and the load.

NRES is low for the reset time delay t_{Reset} ; no mode change is possible during this time.

5. Fail-safe Features

- During a short-circuit at LIN to V_{Battery} , the output limits the output current to $I_{\text{BUS_lim}}$. Due to the power dissipation, the chip temperature exceeds T_{LINoff} and the LIN output is switched off. The chip cools down and after a hysteresis of T_{hys} , switches the output on again. RXD stays on high because LIN is high. During LIN overtemperature switch-off, the V_{CC} regulator is working independently.
- During a short-circuit from LIN to GND the IC can be switched into sleep or silent mode. If the short-circuit disappears, the IC starts with a remote wake-up.
- The reverse current is very low $< 2\mu\text{A}$ at pin LIN during loss of V_{Batt} . This is optimal behavior for bus systems where some slave nodes are supplied from battery or ignition.
- During a short circuit at VCC, the output limits the output current to I_{VCClim} . Because of undervoltage, NRES switches to low and sends a reset to the microcontroller. The IC switches into fail-safe mode. If the chip temperature exceeds the value T_{VCCoff} , the V_{CC} output switches off. The chip cools down and after a hysteresis of T_{hys} , switches the output on again. Because of fail-safe mode, the V_{CC} voltage will switch on again although EN is switched off from the microcontroller. The microcontroller can then start with normal operation.
- Pin EN provides a pull-down resistor to force the transceiver into recessive mode if EN is disconnected.
- Pin RXD is set floating if V_{Batt} is disconnected.
- Pin TXD provides a pull-up resistor to force the transceiver into recessive mode if TXD is disconnected.
- If TXD is short-circuited to GND, it is possible to switch to sleep mode via ENABLE after $t_{\text{dom}} > 20\text{ms}$.

6. Voltage Regulator

Figure 6-1. V_{CC} Voltage Regulator: Ramp Up and Undervoltage

The voltage regulator needs an external capacitor for compensation and to smooth the disturbances from the microcontroller. It is recommended to use an electrolytic capacitor with $C > 1.8\mu F$ and a ceramic capacitor with $C = 100nF$. The values of these capacitors can be varied by the customer, depending on the application.

With this special SO8 package (fused lead frame to pin 3) an R_{thja} of 80K/W is achieved.

Therefore, it is recommended to connect pin 3 with a wide GND plate on the printed board to get a good heat sink.

The main power dissipation of the IC is created from the V_{CC} output current I_{VCC} , which is needed for the application.

Figure 6-2 shows the safe operating area of the Atmel® ATA6625C.

Figure 6-2. Power Dissipation: Safe Operating Area: V_{CC} Output Current versus Supply Voltage V_S at Different Ambient Temperatures Due to $R_{thja} = 80K/W$

To program the microcontroller it may be necessary to supply the V_{CC} output via an external power supply while the V_S Pin of the system basis chip is disconnected. This will not affect the system basis chip.

7. Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

| Parameters | Symbol | Min. | Typ. | Max. | Unit |
|---|------------|-----------|------|------|------------------|
| Supply voltage V_S | V_S | −0.3 | | +40 | V |
| Pulse time $\leq 500\text{ms}$ $T_a = 25^\circ\text{C}$ Output current $I_{VCC} \leq 85\text{mA}$ | V_S | | | +40 | V |
| Pulse time $\leq 2\text{min}$ $T_a = 25^\circ\text{C}$ Output current $I_{VCC} \leq 85\text{mA}$ | V_S | | | 27 | V |

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
