

## High-side current sense amplifier

Datasheet - production data

### Related products

- See TSC103 for higher common-mode operating range (2.9 V to 70 V)

### Applications

- Automotive current monitoring
- Notebook computers
- Server power supplies
- Telecom equipment
- Industrial SMPS
- Current sharing
- LED current measurement

### Features

- Wide common-mode operating range independent of supply: 2.8 V to 30 V
- Wide common-mode survival range: -32 V to 60 V (reversed battery and load-dump conditions)
- Maximum input offset voltage:
  - $\pm 1.5$  mV for  $T_{amb} = 25$  °C
  - $\pm 2.3$  mV for  $-40$  °C  $< T_{amb} < 125$  °C
- Maximum total output voltage error:
  - $\pm 1.5$  % for  $T_{amb} = 25$  °C
  - $\pm 2.5$  % for  $-40$  °C  $< T_{amb} < 125$  °C
- Maximum variation over temperature:
  - $dV_{os}/dT = 8$   $\mu$ V/°C
  - $dV_{out}/dT = 100$  ppm/°C
- Low current consumption:  $I_{CC}$  max = 300  $\mu$ A
- -40 °C to 125 °C operating temperature range
- Internally fixed gain: 20 V/V, 50 V/V
- EMI filtering

### Description

The TSC1021 measures a small differential voltage on a high-side shunt resistor and translates it into a ground-referenced output voltage.

The TSC1021 has been specifically designed for automotive conditions: load-dump protection up to 60 V, reverse-battery protection up to -32 V, ESD protection up to 4 kV and internal filtering for EMI performance.

Input common-mode and power supply voltages are independent: the common-mode voltage can range from 2.8 to 30 V in operating conditions and up to 60 V in absolute maximum ratings while the TSC1021 can be supplied by a 5 V independent supply line.

The TSC1021 is housed in a tiny TSSOP8 package and integrates a buffer that provides low impedance output to ease interfacing and avoid accuracy losses. The overall device current consumption is lower than 300  $\mu$ A.

# 1 Application diagram

The TSC1021 high-side current-sense amplifier features a 2.8 V to 30 V input common-mode range that is independent of the supply voltage. The main advantage of this feature is that it allows high-side current sensing at voltages much greater than the supply voltage ( $V_{CC}$ ).

## 2 Pin configuration

Figure 2: Pin connections (top view)

*Table 1: "Pin description"* describes the function of each pin. Their position is shown in the illustration on the cover page and in *Figure 2: "Pin connections (top view)"* above.

Table 1: Pin description

| Pin number | Symbol   | Type          | Function                                                                                                   |
|------------|----------|---------------|------------------------------------------------------------------------------------------------------------|
| 1          | $V_m$    | Analog input  | Connection for the external sense resistor. The measured current exits the shunt on the $\bar{V}_m$ side.  |
| 3          | Gnd      | Power supply  | Ground line                                                                                                |
| 4          | Out      | Analog output | Buffered output of the current sensing amplifier                                                           |
| 6          | $V_{CC}$ | Power supply  | Positive power supply line                                                                                 |
| 8          | $V_p$    | Analog input  | Connection for the external sense resistor. The measured current enters the shunt on the $\bar{V}_p$ side. |

### 3 Absolute maximum ratings and operating conditions

Table 2: Absolute maximum ratings

| Symbol     | Parameter                                                             | Value      | Unit |
|------------|-----------------------------------------------------------------------|------------|------|
| $V_{id}$   | Input pins differential voltage ( $V_p - V_m$ )                       | $\pm 20$   | V    |
| $V_i$      | Current sensing input pin voltages ( $V_p$ and $V_m$ ) <sup>(1)</sup> | -32 to 60  |      |
| $V_1$      | Voltage for Vcc, Out pins <sup>(1)</sup>                              | -0.3 to 7  |      |
| $T_{stg}$  | Storage temperature                                                   | -65 to 150 | °C   |
| $T_j$      | Maximum junction temperature                                          | 150        |      |
| $R_{thja}$ | TSSOP8 thermal resistance junction to ambient                         | 120        | °C/Ω |
| ESD        | HBM: human body model for $V_p$ and $V_m$ pins <sup>(2)</sup>         | 4          | kV   |
|            | HBM: human body model for all other pins <sup>(2)</sup>               | 2          |      |
|            | MM: machine model <sup>(3)</sup>                                      | 250        | V    |
|            | CDM: charged device model <sup>(4)</sup>                              | 1.5        | kV   |

**Notes:**

<sup>(1)</sup>Voltage values are measured with respect to the GND pin.

<sup>(2)</sup>Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.

<sup>(3)</sup>Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.

<sup>(4)</sup>Charged device model: all pins and package are charged together to the specified voltage and then discharged directly to ground.

Table 3: Operating conditions

| Symbol     | Parameter                                                | Value      | Unit |
|------------|----------------------------------------------------------|------------|------|
| $V_{CC}$   | DC supply voltage from $T_{min}$ to $T_{max}$            | 3.5 to 5.5 | V    |
| $T_{oper}$ | Operational temperature range ( $T_{min}$ to $T_{max}$ ) | -40 to 125 | °C   |
| $V_{icm}$  | Common-mode voltage range ( $V_m$ and $V_p$ pin voltage) | 2.8 to 30  | V    |

## 4 Electrical characteristics

The electrical characteristics given in the following tables are measured under the following test conditions unless otherwise specified:  $T_{amb} = 25\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 5\text{ V}$ ,  $V_{sense} = V_p - V_m = 50\text{ mV}$ ,  $V_m = 12\text{ V}$ , no load on Out, all gain configurations.

Table 4: Supply

| Symbol    | Parameter            | Test conditions                                                                                    | Min. | Typ. | Max. | Unit          |
|-----------|----------------------|----------------------------------------------------------------------------------------------------|------|------|------|---------------|
| $I_{CC}$  | Total supply current | $V_{sense} = 0\text{ V}$ , $-40\text{ }^{\circ}\text{C} < T_{amb} < 125\text{ }^{\circ}\text{C}$   | —    | —    | 300  | $\mu\text{A}$ |
| $I_{CC1}$ | Total supply current | $V_{sense} = 50\text{ mV}$ , $-40\text{ }^{\circ}\text{C} < T_{amb} < 125\text{ }^{\circ}\text{C}$ |      |      | 450  |               |

## 5 Electrical characteristics curves: current sense amplifier

Unless otherwise specified, the test conditions for the following curves are:

- $T_{amb} = 25\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 5\text{ V}$ ,  $V_{sense} = V_p - V_m = 50\text{ mV}$ ,  $V_m = 12\text{ V}$ .
- No load on the Out pin.

## 6 Parameter definitions

### 6.1 Common mode rejection ratio (CMR)

The common-mode rejection ratio (CMR) measures the ability of the current-sensing amplifier to reject any DC voltage applied on both inputs  $V_p$  and  $V_m$ . The CMR is referred back to the input so that its effect can be compared with the applied differential signal. The CMR is defined by the formula:

$$\text{CMR} = -20 \cdot \log \frac{\Delta V_{\text{out}}}{\Delta V_{\text{icm}} \cdot A_v}$$

### 6.2 Supply voltage rejection ratio (SVR)

The supply-voltage rejection ratio (SVR) measures the ability of the current-sensing amplifier to reject any variation of the supply voltage  $V_{CC}$ . The SVR is referred back to the input so that its effect can be compared with the applied differential signal. The SVR is defined by the formula:

$$\text{SVR} = -20 \cdot \log \frac{\Delta V_{\text{out}}}{\Delta V_{\text{cc}} \cdot A_v}$$

### 6.3 Gain ( $A_v$ ) and input offset voltage ( $V_{os}$ )

The input offset voltage is defined as the intersection between the linear regression of the  $V_{\text{out}}$  vs. the  $V_{\text{sense}}$  curve with the X-axis. If  $V_{\text{out1}}$  is the output voltage with  $V_{\text{sense}} = V_{\text{sense1}} = 50$  mV, and  $V_{\text{out2}}$  is the output voltage with  $V_{\text{sense}} = V_{\text{sense2}} = 5$  mV, then  $V_{os}$  can be calculated with the following formula.

$$V_{os} = V_{\text{sense1}} - \frac{V_{\text{sense1}} - V_{\text{sense2}}}{V_{\text{out1}} - V_{\text{out2}}} \cdot V_{\text{out1}}$$

### 6.4 Output voltage drift versus temperature

The output voltage drift versus temperature is defined as the maximum variation of  $V_{\text{out}}$  with respect to its value at 25 °C, over the temperature range. It is calculated as follows:

$$\frac{\Delta V_{\text{out}}}{\Delta T} = \max \left| \frac{V_{\text{out}}(T_{\text{amb}}) - V_{\text{out}}(25^\circ \text{C})}{T_{\text{amb}} - 25^\circ \text{C}} \right|$$

with  $T_{\text{min}} < T_{\text{amb}} < T_{\text{max}}$ .

## 6.5 Output voltage accuracy

The output voltage accuracy is the difference between the actual output voltage and the theoretical output voltage. Ideally, the current sensing output voltage should be equal to the input differential voltage multiplied by the theoretical gain, as in the following formula.

$$V_{\text{out-th}} = A_v \cdot V_{\text{sense}}$$

The actual value is very slightly different, mainly due to the effects of:

- the input offset voltage  $V_{\text{os}}$
- the non-linearity
- the voltage saturation of  $V_{\text{OL}}$  and  $V_{\text{OH}}$

The output voltage accuracy, expressed as a percentage, can be calculated with the following formula.

$$\Delta V_{\text{out}} = \frac{\text{abs}(V_{\text{out}} - (A_v \cdot V_{\text{sense}}))}{A_v \cdot V_{\text{sense}}}$$

With  $A_v = 20 \text{ V/V}$  for TSC1021A and  $A_v = 50 \text{ V/V}$  for TSC1021B.

## 7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: **[www.st.com](http://www.st.com)**. ECOPACK<sup>®</sup> is an ST trademark.

**Стандарт  
Электрон  
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
