

# M93C86, M93C76, M93C66 M93C56, M93C46

16Kbit, 8Kbit, 4Kbit, 2Kbit and 1Kbit (8-bit or 16-bit wide)  
MICROWIRE® Serial Access EEPROM

## FEATURES SUMMARY

- Industry Standard MICROWIRE Bus
- Single Supply Voltage:
  - 4.5 to 5.5V for M93Cx6
  - 2.5 to 5.5V for M93Cx6-W
  - 1.8 to 5.5V for M93Cx6-R
- Dual Organization: by Word (x16) or Byte (x8)
- Programming Instructions that work on: Byte, Word or Entire Memory
- Self-timed Programming Cycle with Auto-Erase: 5ms
- Ready/Busy Signal During Programming
- 2MHz Clock Rate
- Sequential Read Operation
- Enhanced ESD/Latch-Up Behavior
- More than 1 Million Erase/Write Cycles
- More than 40 Year Data Retention
- Packages
  - ECOPACK® (RoHS compliant)

## SUMMARY DESCRIPTION

These electrically erasable programmable memory (EEPROM) devices are accessed through a Serial Data Input (D) and Serial Data Output (Q) using the MICROWIRE bus protocol.

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages.

ECOPACK® packages are Lead-free and RoHS compliant.

ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).

Figure 2. Logic Diagram

Table 2. Signal Names

|     |                     |
|-----|---------------------|
| S   | Chip Select Input   |
| D   | Serial Data Input   |
| Q   | Serial Data Output  |
| C   | Serial Clock        |
| ORG | Organisation Select |
| Vcc | Supply Voltage      |
| Vss | Ground              |

The memory array organization may be divided into either bytes (x8) or words (x16) which may be selected by a signal applied on Organization Se-

lect (ORG). The bit, byte and word sizes of the memories are as shown in Table 3.

Table 3. Memory Size versus Organization

| Device | Number of Bits | Number of 8-bit Bytes | Number of 16-bit Words |
|--------|----------------|-----------------------|------------------------|
| M93C86 | 16384          | 2048                  | 1024                   |
| M93C76 | 8192           | 1024                  | 512                    |
| M93C66 | 4096           | 512                   | 256                    |
| M93C56 | 2048           | 256                   | 128                    |
| M93C46 | 1024           | 128                   | 64                     |

The M93Cx6 is accessed by a set of instructions, as summarized in Table 4., and in more detail in Table 5. to Table 7.).

Table 4. Instruction Set for the M93Cx6

| Instruction | Description                     | Data         |
|-------------|---------------------------------|--------------|
| READ        | Read Data from Memory           | Byte or Word |
| WRITE       | Write Data to Memory            | Byte or Word |
| EWEN        | Erase/Write Enable              |              |
| EWDS        | Erase/Write Disable             |              |
| ERASE       | Erase Byte or Word              | Byte or Word |
| ERAL        | Erase All Memory                |              |
| WRAL        | Write All Memory with same Data |              |

A Read Data from Memory (READ) instruction loads the address of the first byte or word to be read in an internal address register. The data at this address is then clocked out serially. The address register is automatically incremented after the data is output and, if Chip Select Input (S) is held High, the M93Cx6 can output a sequential stream of data bytes or words. In this way, the memory can be read as a data stream from eight to 16384 bits long (in the case of the M93C86), or continuously (the address counter automatically rolls over to 00h when the highest address is reached).

Programming is internally self-timed (the external clock signal on Serial Clock (C) may be stopped or left running after the start of a Write cycle) and does not require an Erase cycle prior to the Write instruction. The Write instruction writes 8 or 16 bits at a time into one of the byte or word locations of the M93Cx6. After the start of the programming cycle, a Busy/Ready signal is available on Serial

Data Output (Q) when Chip Select Input (S) is driven High.

An internal Power-on Data Protection mechanism in the M93Cx6 inhibits the device when the supply is too low.

The DU (Don't Use) pin does not contribute to the normal operation of the device. It is reserved for use by STMicroelectronics during test sequences. The pin may be left unconnected or may be connected to  $V_{CC}$  or  $V_{SS}$ . Direct connection of DU to  $V_{SS}$  is recommended for the lowest stand-by power consumption.

**Figure 3. DIP, SO, TSSOP and MLP Connections (Top View)**

- Note: 1. See [PACKAGE MECHANICAL](#) section for package dimensions, and how to identify pin-1.  
2. DU = Don't Use.

## MEMORY ORGANIZATION

The M93Cx6 memory is organized either as bytes (x8) or as words (x16). If Organization Select (ORG) is left unconnected (or connected to  $V_{CC}$ ) the x16 organization is selected; when Organization Select (ORG) is connected to Ground ( $V_{SS}$ ) the x8 organization is selected. When the M93Cx6

is in stand-by mode, Organization Select (ORG) should be set either to  $V_{SS}$  or  $V_{CC}$  for minimum power consumption. Any voltage between  $V_{SS}$  and  $V_{CC}$  applied to Organization Select (ORG) may increase the stand-by current.

## INTERNAL DEVICE RESET

In order to prevent inadvertent Write operations during Power-up, a Power On Reset (POR) circuit is included.

At Power-up and Power-down, the device must *not* be selected (that is, the Chip Select Input (S) must be driven Low) until the supply voltage reaches the operating voltage  $V_{CC}$  (as defined in Tables 9, 10 and 11).

During Power-up (phase during which  $V_{CC}$  is lower than  $V_{CCmin}$  but increases continuously), the device will not respond to any instruction until  $V_{CC}$  has reached the Power On Reset threshold voltage (this threshold is lower than the minimum  $V_{CC}$  operating voltage defined in [DC AND AC PARAMETERS](#)).

[ETERS](#)). Once  $V_{CC}$  has passed the POR threshold, the device is reset.

Prior to selecting the memory and issuing instructions to it, a valid and stable  $V_{CC}$  voltage must be applied. This voltage must remain stable and valid until the end of the transmission of the instruction and, for a Write instruction, until the completion of the internal write cycle ( $t_w$ ).

During Power-down (phase during which  $V_{CC}$  decreases continuously), as soon as  $V_{CC}$  drops from the normal operating voltage below the Power On Reset threshold voltage, the device stops responding to any instruction sent to it.

## ACTIVE POWER AND STANDBY POWER MODES

When Chip Select (S) is High, the device is selected and in the Active Power mode. It consumes  $I_{CC}$ , as specified in Tables 15, 16, 17, 18 and 19.

When Chip Select (S) is Low, the device is deselected.

If no Erase/Write cycle is in progress when Chip Select goes Low, the device enters the Standby

Power mode, and the power consumption drops to  $I_{CC1}$ .

For the M93Cx6 devices (5V range) the POR threshold voltage is around 3V. For the M93Cx6-W (3V range) and M93Cx6-R (2V range) the POR threshold voltage is around 1.5V.

## INSTRUCTIONS

The instruction set of the M93Cx6 devices contains seven instructions, as summarized in [Table 5](#). to [Table 7](#).. Each instruction consists of the following parts, as shown in [Figure 4](#).:

- Each instruction is preceded by a rising edge on Chip Select Input (S) with Serial Clock (C) being held Low.
- A start bit, which is the first '1' read on Serial Data Input (D) during the rising edge of Serial Clock (C).
- Two op-code bits, read on Serial Data Input (D) during the rising edge of Serial Clock (C). (Some instructions also use the first two bits of the address to define the op-code).

- The address bits of the byte or word that is to be accessed. For the M93C46, the address is made up of 6 bits for the x16 organization or 7 bits for the x8 organization (see [Table 5](#)..). For the M93C56 and M93C66, the address is made up of 8 bits for the x16 organization or 9 bits for the x8 organization (see [Table 6](#)..). For the M93C76 and M93C86, the address is made up of 10 bits for the x16 organization or 11 bits for the x8 organization (see [Table 7](#)..).

The M93Cx6 devices are fabricated in CMOS technology and are therefore able to run as slow as 0 Hz (static input signals) or as fast as the maximum ratings specified in [Table 20](#). to [Table 23](#)..

| EWDS        | Erase/Write Disable             | 1         | 00      | 00X XXXX<br>XXXX         |       | 14                    | 00 XXXX<br>XXXX           |        | 13                    |
| ERASE       | Erase Byte or Word              | 1         | 11      | A10-A0                   |       | 14                    | A9-A0                     |        | 13                    |
| ERAL        | Erase All Memory                | 1         | 00      | 10X XXXX<br>XXXX         |       | 14                    | 10 XXXX<br>XXXX           |        | 13                    |
| WRAL        | Write All Memory with same Data | 1         | 00      | 01X XXXX<br>XXXX         | D7-D0 | 22                    | 01 XXXX<br>XXXX           | D15-D0 | 29                    |

Note: 1. X = Don't Care bit.  
 2. Address bit A10 is not decoded by the M93C76.  
 3. Address bit A9 is not decoded by the M93C76.

**Read**

The Read Data from Memory (READ) instruction outputs data on Serial Data Output (Q). When the instruction is received, the op-code and address are decoded, and the data from the memory is transferred to an output shift register. A dummy 0 bit is output first, followed by the 8-bit byte or 16-bit word, with the most significant bit first. Output data changes are triggered by the rising edge of Serial Clock (C). The M93Cx6 automatically increments the internal address register and clocks out the next byte (or word) as long as the Chip Select Input (S) is held High. In this case, the dummy 0 bit is *not* output between bytes (or words) and a continuous stream of data can be read.

**Erase/Write Enable and Disable**

The Erase/Write Enable (EWEN) instruction enables the future execution of erase or write instructions, and the Erase/Write Disable (EWDS) instruction disables it. When power is first applied, the M93Cx6 initializes itself so that erase and write instructions are disabled. After an Erase/Write Enable (EWEN) instruction has been executed, erasing and writing remains enabled until an Erase/Write Disable (EWDS) instruction is executed, or until  $V_{CC}$  falls below the power-on reset threshold voltage. To protect the memory contents from accidental corruption, it is advisable to issue the Erase/Write Disable (EWDS) instruction after every write cycle. The Read Data from Memory (READ) instruction is not affected by the Erase/Write Enable (EWEN) or Erase/Write Disable (EWDS) instructions.

**Figure 4. READ, WRITE, EWEN, EWDS Sequences**

Note: For the meanings of An, Xn, Qn and Dn, see [Table 5.](#), [Table 6.](#) and [Table 7.](#)

**Erase**

The Erase Byte or Word (ERASE) instruction sets the bits of the addressed memory byte (or word) to 1. Once the address has been correctly decoded, the falling edge of the Chip Select Input (S) starts the self-timed Erase cycle. The completion of the cycle can be detected by monitoring the Ready/Busy line, as described in the [READY/BUSY STATUS](#) section.

**Write**

For the Write Data to Memory (WRITE) instruction, 8 or 16 data bits follow the op-code and address bits. These form the byte or word that is to be written. As with the other bits, Serial Data Input (D) is sampled on the rising edge of Serial Clock (C).

After the last data bit has been sampled, the Chip Select Input (S) must be taken Low before the next rising edge of Serial Clock (C). If Chip Select Input (S) is brought Low before or after this specific time frame, the self-timed programming cycle will not be started, and the addressed location will not be programmed. The completion of the cycle can be detected by monitoring the Ready/Busy line, as described later in this document.

Once the Write cycle has been started, it is internally self-timed (the external clock signal on Serial Clock (C) may be stopped or left running after the start of a Write cycle). The cycle is automatically preceded by an Erase cycle, so it is unnecessary to execute an explicit erase instruction before a Write Data to Memory (WRITE) instruction.

**Figure 5. ERASE, ERAL Sequences**

Note: For the meanings of An and Xn, please see [Table 5.](#), [Table 6.](#) and [Table 7.](#)

## Erase All

The Erase All Memory (ERAL) instruction erases the whole memory (all memory bits are set to 1). The format of the instruction requires that a dummy address be provided. The Erase cycle is conducted in the same way as the Erase instruction (ERASE). The completion of the cycle can be detected by monitoring the Ready/Busy line, as described in the [READY/BUSY STATUS](#) section.

## Write All

As with the Erase All Memory (ERAL) instruction, the format of the Write All Memory with same Data (WRAL) instruction requires that a dummy address be provided. As with the Write Data to Memory (WRITE) instruction, the format of the Write All Memory with same Data (WRAL) instruction requires that an 8-bit data byte, or 16-bit data word, be provided. This value is written to all the addresses of the memory device. The completion of the cycle can be detected by monitoring the Ready/Busy line, as described next.

**Figure 6. WRAL Sequence**

Note: For the meanings of Xn and Dn, please see [Table 5.](#), [Table 6.](#) and [Table 7.](#)

## READY/BUSY STATUS

While the Write or Erase cycle is underway, for a WRITE, ERASE, WRAL or ERAL instruction, the Busy signal (Q=0) is returned whenever Chip Select Input (S) is driven High. (Please note, though, that there is an initial delay, of  $t_{SLSH}$ , before this status information becomes available). In this state, the M93Cx6 ignores any data on the bus.

When the Write cycle is completed, and Chip Select Input (S) is driven High, the Ready signal (Q=1) indicates that the M93Cx6 is ready to receive the next instruction. Serial Data Output (Q) remains set to 1 until the Chip Select Input (S) is brought Low or until a new start bit is decoded.

## INITIAL DELIVERY STATE

The device is delivered with all bits in the memory array set to 1 (each byte contains FFh).

may lead to the writing of erroneous data at an erroneous address.

## COMMON I/O OPERATION

Serial Data Output (Q) and Serial Data Input (D) can be connected together, through a current limiting resistor, to form a common, single-wire data bus. Some precautions must be taken when operating the memory in this way, mostly to prevent a short circuit current from flowing when the last address bit (A0) clashes with the first data bit on Serial Data Output (Q). Please see the application note AN394 for details.

To combat this problem, the M93Cx6 has an on-chip counter that counts the clock pulses from the start bit until the falling edge of the Chip Select Input (S). If the number of clock pulses received is not the number expected, the WRITE, ERASE, ERAL or WRAL instruction is aborted, and the contents of the memory are not modified.

The number of clock cycles expected for each instruction, and for each member of the M93Cx6 family, are summarized in Table 5. to Table 7.. For example, a Write Data to Memory (WRITE) instruction on the M93C56 (or M93C66) expects 20 clock cycles (for the x8 organization) from the start bit to the falling edge of Chip Select Input (S). That is:

## CLOCK PULSE COUNTER

In a noisy environment, the number of pulses received on Serial Clock (C) may be greater than the number delivered by the master (the microcontroller). This can lead to a misalignment of the instruction of one or more bits (as shown in Figure 7.) and

- 1 Start bit
- + 2 Op-code bits
- + 9 Address bits
- + 8 Data bits

## MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-

plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 8. Absolute Maximum Ratings**

| Symbol            | Parameter   | Min.  | Max.                 | Unit |
|-------------------|---|-------|----------------------|------|
| T <sub>A</sub>    | Ambient Operating Temperature                                     | -40   | 130                  | °C   |
| T <sub>STG</sub>  | Storage Temperature   | -65   | 150                  | °C   |
| T <sub>LEAD</sub> | PDIP-Specific Lead Temperature during Soldering                   |       | 260 <sup>(1)</sup>   | °C   |
| V <sub>OUT</sub>  | Output range (Q = V <sub>OH</sub> or Hi-Z)                        | -0.50 | V <sub>CC</sub> +0.5 | V    |
| V <sub>IN</sub>   | Input range   | -0.50 | V <sub>CC</sub> +1   | V    |
| V <sub>CC</sub>   | Supply Voltage  | -0.50 | 6.5                  | V    |
| V <sub>ESD</sub>  | Electrostatic Discharge Voltage (Human Body model) <sup>(2)</sup> | -4000 | 4000                 | V    |

Note: 1. T<sub>LEAD</sub>max must *not* be applied for more than 10s.

2. JEDEC Std JESD22-A114A (C1=100 pF, R1=1500 Ω, R2=500 Ω).

## DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC Characteristic tables that follow are derived from tests performed under the Measure-

ment Conditions summarized in the relevant tables. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

**Table 9. Operating Conditions (M93Cx6)**

| Symbol   | Parameter                                      | Min. | Max. | Unit |

## PART NUMBERING

**Table 29. Ordering Information Scheme**

Example: M93C86 – W MN 6 T P /S

### Device Type

M93 = MICROWIRE serial access EEPROM

### Device Function

86 = 16 Kbit (2048 x 8)

76 = 8 Kbit (1024 x 8)

66 = 4 Kbit (512 x 8)

56 = 2 Kbit (256 x 8)

46 = 1 Kbit (128 x 8)

### Operating Voltage

blank =  $V_{CC} = 4.5$  to  $5.5V$

W =  $V_{CC} = 2.5$  to  $5.5V$

R =  $V_{CC} = 1.8$  to  $5.5V$

### Package

BN = PDIP8

MN = SO8 (150 mil width)

MB = UDFDFPN8 (MLP8)

DW = TSSOP8 (169 mil width)

DS = TSSOP8 (3x3mm body size)

### Device Grade

6 = Industrial temperature range,  $-40$  to  $85$  °C.

Device tested with standard test flow

7 = Device tested with High Reliability Certified Flow<sup>(1)</sup>.

Automotive temperature range ( $-40$  to  $105$  °C)

3 = Device tested with High Reliability Certified Flow<sup>(1)</sup>.

Automotive temperature range ( $-40$  to  $125$  °C)

### Packing

blank = Standard Packing

T = Tape and Reel Packing

### Plating Technology

blank = Standard SnPb plating

P or G = ECOPACK® (RoHS compliant)

### Process<sup>(2)</sup>

/W or /S = F6SP36%

Note: 1. ST strongly recommends the use of the Automotive Grade devices for use in an automotive environment. The High Reliability Certified Flow (HRCF) is described in the quality note QNEE9801. Please ask your nearest ST sales office for a copy.

2. Used only for Device Grade 3.

For a list of available options (speed, package, etc.) or for further information on any aspect of this device, please contact your nearest ST Sales Office.

The category of second-Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label.

## REVISION HISTORY

**Table 30. Document Revision History**

| Date        | Rev. | Description of Revision  |
|-------------|------|--|
| 04-Feb-2003 | 2.0  | Document reformatted, and reworded, using the new template. Temperature range 1 removed. TSSOP8 (3x3mm) package added. New products, identified by the process letter W, added, with $f_c(\max)$ increased to 1MHz for -R voltage range, and to 2MHz for all other ranges (and corresponding parameters adjusted)  |
| 26-Mar-2003 | 2.1  | Value of standby current (max) corrected in DC characteristics tables for -W and -R ranges $V_{OUT}$ and $V_{IN}$ separated from $V_{IO}$ in the Absolute Maximum Ratings table  |
| 04-Apr-2003 | 2.2  | Values corrected in AC characteristics tables for -W range ( $t_{SLSH}$ , $t_{DVCH}$ , $t_{CLSL}$ ) for devices with Process Identification Letter W   |
| 23-May-2003 | 2.3  | Standby current corrected for -R range   |
| 27-May-2003 | 2.4  | Turned-die option re-instated in Ordering Information Scheme   |
| 25-Nov-2003 | 3.0  | Table of contents, and Pb-free options added. Temperature range 7 added. $V_{IL}(\min)$ improved to $-0.45V$ .   |
| 30-Mar-2004 | 4.0  | MLP package added. Absolute Maximum Ratings for $V_{IO}(\min)$ and $V_{CC}(\min)$ changed. Soldering temperature information clarified for RoHS compliant devices. Device grade information clarified. Process identification letter "G" information added   |
| 16-Aug-2004 | 5.0  | M93C06 removed. Device grade information further clarified. Process identification letter "S" information added. Turned-die package option removed. Product list summary added.  |
| 27-Oct-2005 | 6.0  | current product/new product distinction removed. $I_{CC}$ and $I_{CC1}$ values for current product removed from tables 15, 16 and 17 and AC characteristics for current product removed from Tables 20 and 21. Clock rate added to <a href="#">FEATURES SUMMARY</a> . "Q = open" added to $I_{CC}$ Test conditions in DC Characteristics Tables 15, 16, 17, 18 and 19. <a href="#">Process<sup>(2)</sup></a> added to <a href="#">Table 29.</a> , <a href="#">Ordering Information Scheme</a> . POWER ON DATA PROTECTION section removed, replaced by <a href="#">INTERNAL DEVICE RESET</a> and <a href="#">ACTIVE POWER AND STANDBY POWER MODES</a> . <a href="#">INITIAL DELIVERY STATE</a> added. SO8N and TSSOP8 packages updated. PDIP-specific $T_{LEAD}$ added to <a href="#">Table 8.</a> , <a href="#">Absolute Maximum Ratings</a> . |

## Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
