General Description

The HMC630LP3 & HMC630LP3E are high dynamic range Vector Modulator RFICs which are targeted for RF predistortion and feed-forward cancellation circuits, as well as RF beam forming and amplitude/phase correction circuits. The I & Q ports of the HMC630LP3(E) can be used to continuously vary the phase and amplitude of RF signals by up to 360 degrees and 40 dB respectively, while supporting a 3 dB modulation bandwidth of 180 MHz. With an output IP3 of +24.5 dBm and output noise floor of -162 dBm/Hz (at maximum gain setting), the output IP3/noise floor ratio is 186.5 dB.

Electrical Specifications, $T_A = +25^\circ\text{C}$, $V_{CC} = +8\text{V}$

Pin Description

Pin Number	Function	Description	Interface Schematic
1, 4, 10 - 12	N/C	No connection. These pins may be connected to RF ground. Performance will not be affected	
2, 3	IN, $\overline{\text{IN}}$	Differential RF inputs, 100 Ohms differential impedance. (i.e. each pin is 50 Ohms to ground). Must be DC blocked.	
5, 15	I	In-phase control input. Pins 5 and 15 are redundant. Either input can be used.	
6, 16	Q	Quadrature control input. Pins 6 and 16 are redundant. Either input can be used.	
7, 8, 13, 14	Vcc	Supply Voltage, pins are DC connected on-chip. It is only necessary to supply Vcc to any 1 of the 4 pins, but all 4 pins must be bypassed to ground. (See application circuit).	
9	RFOUT	RF Output: Must be DC blocked.	
	GND	Ground: Backside of package has exposed metal ground paddle which must be connected to RF/DC ground.	

Application Circuit

* Pins 15 & 16 are redundant I & Q inputs.

Gain and Phase control are applied through the I and Q control ports. For a given linear gain (G) and phase (θ) setting, the voltages applied to these ports in all measurements are calculated as follows:

$$I(G, \theta) = V_{mi} + 1.0V \frac{G}{G_{max}} \cos(\theta)$$

$$Q(G, \theta) = V_{mq} + 1.0V \frac{G}{G_{max}} \sin(\theta)$$

Where V_{mi} and V_{mq} are the I and Q voltage settings corresponding to maximum isolation at room temperature and $F = 0.9$ GHz. Note that $G = 10^x$ and $G_{max} = 10^y$ where $x = \frac{\text{Gain Setting (dB)}}{20}$ and $y = \frac{\text{Max Gain Setting (dB)}}{20}$. Nominally $V_{mi} = V_{mq} = 1.5V$, $G_{max} = 0.316$.

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation board should be mounted to an appropriate heat sink. The evaluation circuit board shown is available from Hittite upon request.
