

FEATURES

- PLL generated or direct master clock
- Low EMI design
- 112 dB DAC/107 dB ADC dynamic range and SNR
- −94 dB THD + N
- Single 3.3 V supply
- Tolerance for 5 V logic inputs
- Supports 24-bits and 8 kHz to 192 kHz sample rates
- Differential ADC input
- Differential DAC output
- Log volume control with autoramp function
- SPI controllable for flexibility
- Software-controllable clickless mute
- Software power-down
- Right-justified, left-justified, I²S, and TDM modes
- Master and slave modes up to 16-channel input/output
- 64-lead LQFP package
- Qualified for automotive applications

APPLICATIONS

- Automotive audio systems
- Home Theater Systems
- Set-top boxes
- Digital audio effects processors

GENERAL DESCRIPTION

The **AD1939** is a high performance, single-chip codec that provides four analog-to-digital converters (ADCs) with differential input, and eight digital-to-analog converters (DACs) with differential output using the Analog Devices, Inc. patented multibit sigma-delta (Σ - Δ) architecture. An SPI port is included, allowing a microcontroller to adjust volume and many other parameters. The **AD1939** operates from 3.3 V digital and analog supplies. The **AD1939** is available in a 64-lead (differential output) LQFP package.

The **AD1939** is designed for low EMI. This consideration is apparent in both the system and circuit design architectures. By using the on-board PLL to derive the master clock from the LR clock or from an external crystal, the **AD1939** eliminates the need for a separate high frequency master clock and can also be used with a suppressed bit clock. The DACs and ADCs are designed using the latest Analog Devices continuous time architectures to further minimize EMI. By using 3.3 V supplies, power consumption is minimized, further reducing emissions.

7/06—Revision 0: Initial Version

SPECIFICATIONS

TEST CONDITIONS

Performance of all channels is identical, exclusive of the interchannel gain mismatch and interchannel phase deviation specifications.

| | |
|-----------------------------------|--|
| Supply voltages (AVDD, DVDD) | 3.3 V |
| Temperature range ¹ | As specified in Table 1 and Table 2 |
| Master clock | 12.288 MHz (48 kHz f_s , 256 × f_s mode) |
| Input sample rate | 48 kHz |
| Measurement bandwidth | 20 Hz to 20 kHz |
| Word width | 24 bits |
| Load capacitance (digital output) | 20 pF |
| Load current (digital output) | ±1 mA or 1.5 kΩ to ½ DVDD supply |
| Input voltage high | 2.0 V |
| Input voltage low | 0.8 V |

¹ Functionally guaranteed at –40°C to +125°C case temperature.

ANALOG PERFORMANCE SPECIFICATIONS

Specifications guaranteed at an ambient temperature of 25°C.

Table 1.

| Parameter | Conditions/Comments | Min | Typ | Max | Unit |
|---|-------------------------------|-------|-------------|-------|---------------|
| ANALOG-TO-DIGITAL CONVERTERS | | | | | |
| ADC Resolution | All ADCs | | 24 | | Bits |
| Dynamic Range | 20 Hz to 20 kHz, –60 dB input | | | | |
| No Filter (RMS) | | 96 | 102 | | dB |
| With A-Weighted Filter (RMS) | | 98 | 105 | | dB |
| Total Harmonic Distortion + Noise | –1 dBFS | | –96 | –87 | dB |
| Full-Scale Input Voltage (Differential) | | | 1.9 | | V rms |
| Gain Error | | –10 | | +10 | % |
| Interchannel Gain Mismatch | | –0.25 | | +0.25 | dB |
| Offset Error | | –10 | 0 | +10 | mV |
| Gain Drift | | | 100 | | ppm/°C |
| Interchannel Isolation | | | –110 | | dB |
| CMRR | 100 mV rms, 1 kHz | | 55 | | dB |
| | 100 mV rms, 20 kHz | | 55 | | dB |
| Input Resistance | | | 14 | | kΩ |
| Input Capacitance | | | 10 | | pF |
| Input Common-Mode Bias Voltage | | | 1.5 | | V |
| DIGITAL-TO-ANALOG CONVERTERS | | | | | |
| Dynamic Range | 20 Hz to 20 kHz, –60 dB input | | | | |
| No Filter (RMS) | | 102 | 107 | | dB |
| With A-Weighted Filter (RMS) | | 105 | 110 | | dB |
| With A-Weighted Filter (Average) | | | 112 | | dB |
| Total Harmonic Distortion + Noise | 0 dBFS | | | | |
| | Two channels running | | –94 | | dB |
| | Eight channels running | | –86 | –76 | dB |
| Full-Scale Output Voltage | | | 1.76 (4.96) | | V rms (V p-p) |
| Gain Error | | –10 | | +10 | % |
| Interchannel Gain Mismatch | | –0.2 | | +0.2 | dB |
| Offset Error | | –25 | –6 | +25 | mV |
| Gain Drift | | –30 | | +30 | ppm/°C |
| Interchannel Isolation | | | 100 | | dB |

| Parameter | Conditions/Comments | Min | Typ | Max | Unit |
|-------------------------------|---------------------|------|-------|------|---------|
| Interchannel Phase Deviation | | | 0 | | Degrees |
| Volume Control Step | | | 0.375 | | dB |
| Volume Control Range | | | 95 | | dB |
| De-emphasis Gain Error | | | | ±0.6 | dB |
| Output Resistance at Each Pin | | | 100 | | Ω |
| REFERENCE | | | | | |
| Internal Reference Voltage | FILTR pin | | 1.50 | | V |
| External Reference Voltage | FILTR pin | 1.32 | 1.50 | 1.68 | V |
| Common-Mode Reference Output | CM pin | | 1.50 | | V |
| REGULATOR | | | | | |
| Input Supply Voltage | VSUPPLY pin | 4.5 | 5 | 5.5 | V |
| Regulated Output Voltage | VSENSE pin | 3.19 | 3.37 | 3.55 | V |

Specifications measured at a case temperature of 125°C.

ABSOLUTE MAXIMUM RATINGS

Table 8.

| Parameter | Rating |
|-------------------------------------|------------------------|
| Analog (AVDD) | −0.3 V to +3.6 V |
| Digital (DVDD) | −0.3 V to +3.6 V |
| VSUPPLY | −0.3 V to +6.0 V |
| Input Current (Except Supply Pins) | ±20 mA |
| Analog Input Voltage (Signal Pins) | −0.3 V to AVDD + 0.3 V |
| Digital Input Voltage (Signal Pins) | −0.3 V to DVDD + 0.3 V |
| Operating Temperature Range (Case) | −40°C to +125°C |
| Storage Temperature Range | −65°C to +150°C |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} represents thermal resistance, junction-to-ambient;

θ_{JC} represents the thermal resistance, junction-to-case.

All characteristics are for a 4-layer board.

Table 9. Thermal Resistance

| Package Type | θ_{JA} | θ_{JC} | Unit |
|--------------|---------------|---------------|------|
| 64-Lead LQFP | 47 | 11.1 | °C/W |

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

068071-021

Figure 2. 64-Lead LQFP, Differential Output, Pin Configuration

Table 10. Pin Function Descriptions

| Pin No. | In/Out | Mnemonic | Description |
|---------|--------|----------|--|
| 1 | I | AGND | Analog Ground. |
| 2 | I | MCLKI/XI | Master Clock Input/Crystal Oscillator Input. |
| 3 | O | MCLKO/XO | Master Clock Output/Crystal Oscillator Output. |
| 4 | I | AGND | Analog Ground. |
| 5 | I | AVDD | Analog Power Supply. Connect to analog 3.3 V supply. |
| 6 | O | OL3P | DAC 3 Left Positive Output. |
| 7 | O | OL3N | DAC 3 Left Negative Output. |
| 8 | O | OR3P | DAC 3 Right Positive Output. |
| 9 | O | OR3N | DAC 3 Right Negative Output. |
| 10 | O | OL4P | DAC 4 Left Positive Output. |
| 11 | O | OL4N | DAC 4 Left Negative Output. |
| 12 | O | OR4P | DAC 4 Right Positive Output. |
| 13 | O | OR4N | DAC 4 Right Negative Output |
| 14 | I | PD/RST | Power-Down Reset (Active Low). |
| 15 | I/O | DSDATA4 | DAC Serial Data Input 4. Data input to DAC4 data in/TDM DAC2 data out (dual-line mode)/AUX DAC2 data out (to external DAC2). |
| 16 | I | DGND | Digital Ground. |
| 17 | I | DVDD | Digital Power Supply. Connect to digital 3.3 V supply. |
| 18 | I/O | DSDATA3 | DAC Serial Data Input 3. Data input to DAC3 data in/TDM DAC2 data in (dual-line mode)/AUX ADC2 data in (from external ADC2). |
| 19 | I/O | DSDATA2 | DAC Serial Data Input 2. Data input to DAC2 data in/TDM DAC data out/AUX ADC1 data in (from external ADC1). |
| 20 | I | DSDATA1 | DAC Serial Data Input 1. Data input to DAC1 data in/TDM DAC data in/TDM data in. |
| 21 | I/O | DBCLK | Bit Clock for DACs. |
| 22 | I/O | DLRCLK | LR Clock for DACs. |

| Pin No. | In/Out | Mnemonic | Description |
|---------|--------|----------|---|
| 23 | I | VSUPPLY | 5 V Input to Regulator, Emitter of Pass Transistor. |
| 24 | I | VSENSE | 3.3 V Output of Regulator, Collector of Pass Transistor. |
| 25 | O | VDRIVE | Drive for Base of Pass Transistor. |
| 26 | I/O | ASDATA2 | ADC Serial Data Output 2. Data Output from ADC2/TDM ADC data in/AUX DAC1 data out (to external DAC1). |
| 27 | O | ASDATA1 | ADC Serial Data Output 1. Data Output from ADC1/TDM ADC data out/TDM data out. |
| 28 | I/O | ABCLK | Bit Clock for ADCs. |
| 29 | I/O | ALRCLK | LR Clock for ADCs. |
| 30 | I | CIN | Control Data Input (SPI). |
| 31 | I/O | COUT | Control Data Output (SPI). |
| 32 | I | DVDD | Digital Power Supply. Connect to digital 3.3 V supply. |
| 33 | I | DGND | Digital Ground. |
| 34 | I | CCLK | Control Clock Input (SPI). |
| 35 | I | CLATCH | Latch Input for Control Data (SPI). |
| 36 | O | OL1P | DAC 1 Left Positive Output. |
| 37 | O | OL1N | DAC 1 Left Negative Output. |
| 38 | O | OR1P | DAC 1 Right Positive Output. |

THEORY OF OPERATION

ANALOG-TO-DIGITAL CONVERTERS (ADCS)

There are four analog-to-digital converter (ADC) channels in the [AD1939](#) configured as two stereo pairs with differential inputs. The ADCs can operate at a nominal sample rate of 48 kHz, 96 kHz, or 192 kHz. The ADCs include on-board digital anti-aliasing filters with 79 dB stop-band attenuation and linear phase response, operating at an oversampling ratio of 128 (48 kHz, 96 kHz, and 192 kHz modes). Digital outputs are supplied through two serial data output pins (one for each stereo pair) and a common frame clock (ALRCLK) and bit clock (ABCLK). Alternatively, one of the TDM modes can be used to access up to 16 channels on a single TDM data line.

The ADCs must be driven from a differential signal source for best performance. The input pins of the ADCs connect to internal switched capacitors. To isolate the external driving op amp from the glitches caused by the internal switched capacitors, each input pin should be isolated by using a series-connected external 100 Ω resistor together with a 1 nF capacitor connected from each input to ground. This capacitor must be of high quality, for example, ceramic NP0 or polypropylene film.

The differential inputs have a nominal common-mode voltage of 1.5 V. The voltage at the common-mode reference pin (CM) can be used to bias external op amps to buffer the input signals (see the Power Supply and Voltage Reference section). The inputs can also be ac-coupled and do not need an external dc bias to CM.

A digital high-pass filter can be switched in line with the ADCs under serial control to remove residual dc offsets. It has a 1.4 Hz, 6 dB per octave cutoff at a 48 kHz sample rate. The cutoff frequency scales directly with sample frequency.

DIGITAL-TO-ANALOG CONVERTERS (DACs)

The [AD1939](#) digital-to-analog converter (DAC) channels are arranged as differential, four stereo pairs giving eight analog outputs for improved noise and distortion performance. The DACs include on-board digital reconstruction filters with 70 dB stop-band attenuation and linear phase response, operating at an oversampling ratio of 4 (48 kHz or 96 kHz modes) or 2 (192 kHz mode). Each channel has its own independently programmable attenuator, adjustable in 255 steps in increments of 0.375 dB. Digital inputs are supplied through four serial data input pins (one for each stereo pair) and a common frame clock (DLRCLK) and bit clock (DBCLK). Alternatively, one of the TDM modes can be used to access up to 16 channels on a single TDM data line.

Each output pin has a nominal common-mode dc level of 1.5 V and swings ± 1.27 V for a 0 dBFS digital input signal. A single op amp, third-order, external, low-pass filter is recommended to remove high frequency noise present on the output pins, as well as to provide differential-to-single-ended conversion in the case of the differential output. Note that the use of op amps with low

slow rate or low bandwidth can cause high frequency noise and tones to fold down into the audio band; exercise care in selecting these components.

The voltage at CM, the common-mode reference pin, can be used to bias the external op amps that buffer the output signals (see the Power Supply and Voltage Reference section).

CLOCK SIGNALS

The on-chip phase-locked loop (PLL) can be selected to reference the input sample rate from either of the LRCLK pins or 256, 384, 512, or 768 times the sample rate, referenced to the 48 kHz mode from the MCLKI/XI pin. The default at power-up is $256 \times f_s$ from the MCLKI/XI pin. In 96 kHz mode, the master clock frequency stays at the same absolute frequency; therefore, the actual multiplication rate is divided by 2. In 192 kHz mode, the actual multiplication rate is divided by 4. For example, if a device in the [AD1939](#) family is programmed in $256 \times f_s$ mode, the frequency of the master clock input is $256 \times 48 \text{ kHz} = 12.288 \text{ MHz}$. If the [AD1939](#) is then switched to 96 kHz operation (by writing to the SPI port), the frequency of the master clock should remain at 12.288 MHz, which is $128 \times f_s$ in this example. In 192 kHz mode, this becomes $64 \times f_s$.

The internal clock for the ADCs is $256 \times f_s$ for all clock modes. The internal clock for the DACs varies by mode: $512 \times f_s$ (48 kHz mode), $256 \times f_s$ (96 kHz mode), or $128 \times f_s$ (192 kHz mode). By default, the on-board PLL generates this internal master clock from an external clock. A direct $512 \times f_s$ (referenced to 48 kHz mode) master clock can be used for either the ADCs or DACs if selected in the PLL and Clock Control 1 register.

Note that it is not possible to use a direct clock for the ADCs set to the 192 kHz mode. It is required that the on-chip PLL be used in this mode.

The PLL can be powered down in the PLL and Clock Control 0 register. To ensure reliable locking when changing PLL modes, or if the reference clock is unstable at power-on, power down the PLL and then power it back up when the reference clock stabilizes.

The internal master clock (MCLK) can be disabled in the PLL and Clock Control 0 register to reduce power dissipation when the [AD1939](#) is idle. The clock should be stable before it is enabled. Unless a standalone mode is selected (see the Serial Control Port section), the clock is disabled by reset and must be enabled by writing to the SPI port for normal operation.

To maintain the highest performance possible, limit the clock jitter of the internal master clock signal to less than a 300 ps rms time interval error (TIE). Even at these levels, extra noise or tones can appear in the DAC outputs if the jitter spectrum contains large spectral peaks. If the internal PLL is not used, it is best to use an independent crystal oscillator to generate the

master clock. In addition, it is especially important that the clock signal not pass through an FPGA, CPLD, or other large digital chip (such as a DSP) before being applied to the AD1939. In most cases, this induces clock jitter due to the sharing of common power and ground connections with other unrelated digital output signals. When the PLL is used, jitter in the reference clock is attenuated above a certain frequency depending on the loop filter.

RESET AND POWER-DOWN

The function of the $\overline{\text{RST}}$ pin sets all the control registers to their default settings. To avoid pops, reset does not power down the analog outputs. After $\overline{\text{RST}}$ is deasserted and the PLL acquires lock condition, an initialization routine runs inside the AD1939. This initialization lasts for approximately 256 master clock cycles.

The power-down bits in the PLL and Clock Control 0, DAC Control 1, and ADC Control 1 registers power down the respective sections. All other register settings are retained. To guarantee proper startup, the $\overline{\text{RST}}$ pin should be pulled low by an external resistor.

SERIAL CONTROL PORT

The AD1939 has an SPI control port that permits programming and reading back of the internal control registers for the ADCs, DACs, and clock system. A standalone mode is also available

for operation without serial control; standalone is configured at reset by connecting CIN, CCLK, and $\overline{\text{CLATCH}}$ to ground. In standalone mode, all registers are set to default, except the internal MCLK enable, which is set to 1. The ADC, ABCLK, and ALRCLK clock ports are set to master/slave by the connecting the COUT pin to either DVDD or ground. Standalone mode only supports stereo mode with an I2S data format and 256 fs MCLK rate. Refer to Table 11 for details. If CIN, CCLK, and $\overline{\text{CLATCH}}$ are not grounded, the AD1939 SPI port is active. It is recommended to use a weak pull-up resistor on $\overline{\text{CLATCH}}$ in applications that have a microcontroller. This pull-up resistor ensures that the AD1939 recognizes the presence of a microcontroller.

The SPI control port of the AD1939 is a 4-wire serial control port. The format is similar to the Motorola SPI format except the input data-word is 24 bits wide. The serial bit clock and latch can be completely asynchronous to the sample rate of the ADCs and DACs. Figure 11 shows the format of the SPI signal. The first byte is a global address with a read/write bit. For the AD1939, the address is 0x04, shifted left one bit due to the R/W bit. The second byte is the AD1939 register address and the third byte is the data.

Table 11. Standalone Mode Selection

| ADC Clocks | CIN | COUT | CCLK | $\overline{\text{CLATCH}}$ |
|------------|-----|------|------|----------------------------|
| Slave | 0 | 0 | 0 | 0 |
| Master | 0 | 1 | 0 | 0 |

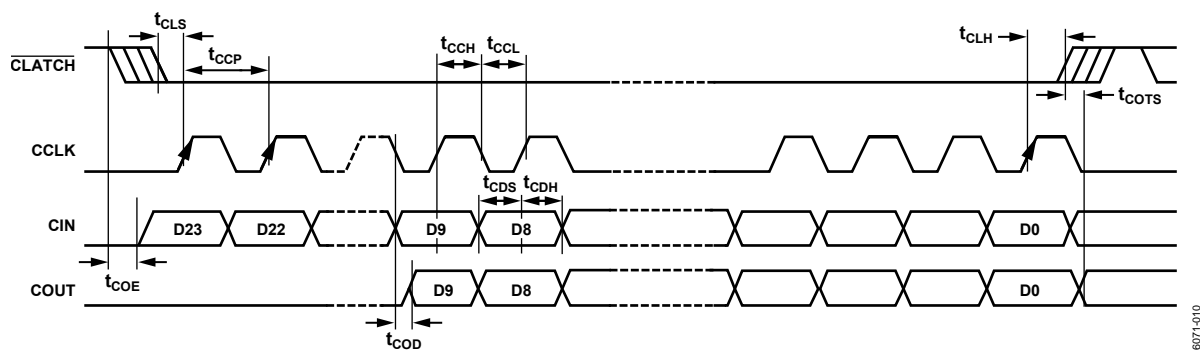

Figure 11. Format of the SPI Signal

POWER SUPPLY AND VOLTAGE REFERENCE

The AD1939 is designed for 3.3 V supplies. Separate power supply pins are provided for the analog and digital sections. To minimize noise pickup, these pins should be bypassed with 100 nF ceramic chip capacitors placed as close to the pins as possible. A bulk aluminum electrolytic capacitor of at least 22 μ F should also be provided on the same PC board as the codec. For critical applications, improved performance is obtained with separate supplies for the analog and digital sections. If this is not possible, it is recommended that the analog and digital supplies be isolated by means of a ferrite bead in series with each supply. It is important that the analog supply be as clean as possible.

The AD1939 includes a 3.3 V regulator driver that only requires an external pass transistor and bypass capacitors to make a 5 V to 3.3 V regulator. If the regulator driver is not used, connect VSUPPLY, VDRIVE, and VSENSE to DGND.

All digital inputs are compatible with TTL and CMOS levels. All outputs are driven from the 3.3 V DVDD supply and are compatible with TTL and 3.3 V CMOS levels.

The ADC and DAC internal voltage reference (V_{REF}) is brought out on FILTR and should be bypassed as close as possible to the chip with a parallel combination of 10 μ F and 100 nF. Any external current drawn should be limited to less than 50 μ A.

The internal reference can be disabled in the PLL and Clock Control 1 register and FILTR can be driven from an external source. This can be used to scale the DAC output to the clipping level of a power amplifier based on its power supply voltage. The ADC input gain varies by the inverse ratio. The total gain from ADC input to DAC output remains constant.

The CM pin is the internal common-mode reference. It should be bypassed as close as possible to the chip, with a parallel combination of 47 μ F and 100 nF. This voltage can be used to bias external op amps to the common-mode voltage of the input and output signal pins. The output current should be limited to less than 0.5 mA source and 2 mA sink.

SERIAL DATA PORTS—DATA FORMAT

The eight DAC channels use a common serial bit clock (DBCLK) and a common left-right framing clock (DLRCLK) in the serial data port. The four ADC channels use a common serial bit clock (ABCLK) and left-right framing clock (ALRCLK) in the serial data port. The clock signals are all synchronous with the sample rate. The normal stereo serial modes are shown in Figure 23.

The ADC and DAC serial data modes default to I²S. The ports can also be programmed for left-justified, right-justified, and TDM modes. The word width is 24 bits by default and can be programmed for 16 or 20 bits. The DAC serial formats are programmable according to the DAC Control 0 register. The

polarity of DBCLK and DLRCLK is programmable according to the DAC Control 1 register. The ADC serial formats and serial clock polarity are programmable according to the ADC Control 1 register. Both DAC and ADC serial ports are programmable to become the bus masters according to DAC Control 1 register and ADC Control 2 register. By default, both ADC and DAC serial ports are in the slave mode.

TIME-DIVISION MULTIPLEXED (TDM) MODES

The AD1939 serial ports also have several different TDM serial data modes. The first and most commonly used configurations are shown in Figure 12 and Figure 13. In Figure 12, the ADC serial port outputs one data stream consisting of four on-chip ADCs followed by four unused slots. In Figure 13, the eight on-chip DAC data slots are packed into one TDM stream. In this mode, both DBCLK and ABCLK are 256 fs.

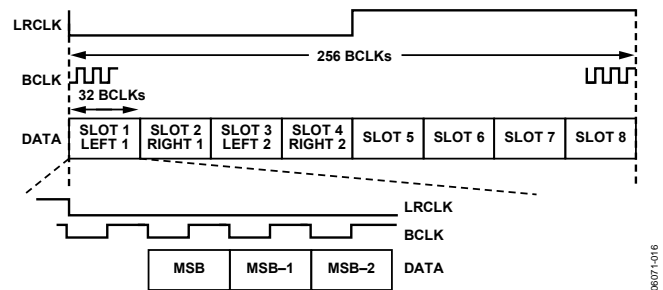

Figure 12. ADC TDM (8-Channel I²S Mode)

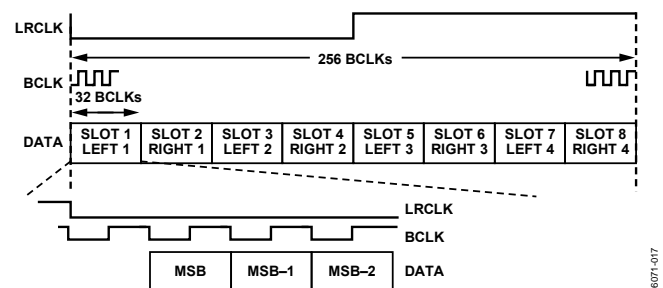

Figure 13. DAC TDM (8-Channel I²S Mode)

The I/O pins of the serial ports are defined according to the serial mode that is selected. For a detailed description of the function of each pin in TDM and AUX modes, see Table 12.

The AD1939 allows systems with more than eight DAC channels to be easily configured by the use of an auxiliary serial data port. The DAC TDM-AUX mode is shown in Figure 14. In this mode, the AUX channels are the last four slots of the TDM data stream. These slots are extracted and output to the AUX serial port. It should be noted that due to the high DBCLK frequency, this mode is available only in the 48 kHz/44.1 kHz/32 kHz sample rate.

The AD1939 also allows system configurations with more than four ADC channels as shown in Figure 15 (using 8 ADCs) and Figure 16 (using 16 ADCs). Again, due to the high ABCLK frequency, this mode is available only in the 48 kHz/44.1 kHz/32 kHz sample rate.

Combining the AUX ADC and DAC modes results in a system configuration of 8 ADCs and 12 DACs. The system, then, consists of two external stereo ADCs, two external stereo DACs,

and one AD1939. This mode is shown in Figure 17 (combined AUX DAC and ADC modes).

Table 12. Pin Function Changes in TDM and AUX Modes

| Pin Mnemonic | Stereo Modes | TDM Modes | AUX Modes |

DAISY-CHAIN MODE

The AD1939 also allows a daisy-chain configuration to expand the system to 8 ADCs and 16 DACs (see Figure 18). In this mode, the DBCLK frequency is 512 f_s. The first eight slots of the DAC TDM data stream belong to the first AD1939 in the chain and the last eight slots belong to the second AD1939. The second AD1939 is the device attached to the DSP TDM port.

To accommodate 16 channels at a 96 kHz sample rate, the AD1939 can be configured into a dual-line, TDM mode as shown in Figure 19. This mode allows a slower DBCLK than normally required by the one-line TDM mode.

Again, the first four channels of each TDM input belong to the first AD1939 in the chain and the last four channels belong to the second AD1939.

The dual-line TDM mode can also be used to send data at a 192 kHz sample rate into the AD1939 as shown in Figure 20.

There are two configurations for the ADC port to work in daisy-chain mode. The first one is with an ABCLK at 256 f_s shown in Figure 21. The second configuration is shown in Figure 22. Note that in the 512 f_s ABCLK mode, the ADC channels occupy the first eight slots; the second eight slots are empty. The TDM_IN of the first AD1939 must be grounded in all modes of operation.

The I/O pins of the serial ports are defined according to the serial mode selected. See Table 13 for a detailed description of the function of each pin. See Figure 26 for a typical AD1939 configuration with two external stereo DACs and two external stereo ADCs.

Figure 23 through Figure 25 show the serial mode formats. For maximum flexibility, the polarity of LRCLK and BCLK are programmable. In these figures, all of the clocks are shown with their normal polarity. The default mode is I²S.

NOTES

1. DSP MODE DOES NOT IDENTIFY CHANNEL.
2. LRCLK NORMALLY OPERATES AT f_s EXCEPT FOR DSP MODE, WHICH IS $2 \times f_s$.
3. BCLK FREQUENCY IS NORMALLY $64 \times$ LRCLK BUT MAY BE OPERATED IN BURST MODE.

CONTROL REGISTERS

DEFINITIONS

The global address for the AD1939 is 0x04, shifted left one bit due to the $\overline{R/W}$ bit. All registers are reset to 0, except for the DAC volume registers that are set to full volume.

Note that the first setting in each control register parameter is the default setting.

Table 14. Register Format

| | Global Address | $\overline{R/W}$ | Register Address | Data |
|-----|----------------|------------------|------------------|------|

Table 25. ADC Control 2 Register

| Bit | Value | Function | Description |
|-----|-------|---|--------------------|
| 0 | 0 | 50/50 (allows 32, 24, 20, or 16 bit clocks (BCLKs) per channel) | LRCLK format |
| | 1 | Pulse (32 BCLKs per channel) | |
| 1 | 0 | Drive out on falling edge (DEF) | BCLK polarity |
| | 1 | Drive out on rising edge | |
| 2 | 0 | Left low | LRCLK polarity |
| | 1 | Left high | |
| 3 | 0 | Slave | LRCLK master/slave |
| | 1 | Master | |
| 5:4 | 00 | 64 | BCLKs per frame |
| | 01 | 128 | |
| | 10 | 256 | |
| | 11 | 512 | |
| 6 | 0 | Slave | BCLK master/slave |
| | 1 | Master | |
| 7 | 0 | ABCLK pin | BCLK source |
| | 1 | Internally generated | |

ADDITIONAL MODES

The AD1939 offers several additional modes for board level design enhancements. To reduce the EMI in board level design, serial data can be transmitted without an explicit BCLK. See Figure 27 for an example of a DAC TDM data transmission mode that does not require high speed DBCLK. This configuration is applicable when the AD1939 master clock is generated by the PLL with the DLRCLK as the PLL reference frequency.

To relax the requirement for the setup time of the AD1939 in cases of high speed TDM data transmission, the AD1939 can latch in the data using the falling edge of DBCLK. This effectively dedicates the entire BCLK period to the setup time. This mode is useful in cases where the source has a large delay time in the serial data driver. Figure 28 shows this pipeline mode of data transmission.

Both the BCLK-less and pipeline modes are available on the ADC serial data port.

Figure 27. Serial DAC Data Transmission in TDM Format Without DBCLK
(Applicable Only If PLL Locks to DLRCLK, This Mode Is Also Available in the ADC Serial Data Port)

APPLICATION CIRCUITS

Typical application circuits are shown in Figure 29 through Figure 32. Figure 29 shows a typical ADC input filter circuit. Recommended loop filters for LR clock and master clock as the PLL reference are shown in Figure 30. Output filters for the DAC outputs are shown in Figure 31 and a regulator circuit is shown in Figure 32.

ORDERING GUIDE

| Model ^{1, 2} | Temperature Range | Package Description | Package Option |
|-----------------------|-------------------|---------------------------------|----------------|
| AD1939YSTZ | −40°C to +105°C | 64-Lead LQFP | ST-64-2 |
| AD1939YSTZRL | −40°C to +105°C | 64-Lead LQFP, 13" Tape and Reel | ST-64-2 |
| AD1939WBSTZ | −40°C to +105°C | 64-Lead LQFP | ST-64-2 |
| AD1939WBSTZ-RL | −40°C to +105°C | 64-Lead LQFP, 13" Tape and Reel | ST-64-2 |
| EVAL-AD1939AZ | | Evaluation Board | |

¹ Z = RoHS Compliant Part.

² W = Qualified for Automotive Applications.

AUTOMOTIVE PRODUCTS

The [AD1939W](#) models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.

NOTES

**Стандарт
Электрон
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
