## FRACTIONAL-N PLL WITH INTEGRATED VCO, 11.5 - 12.5 GHz

### General Description

The HMC783LP6CE is a fully functioned Fractional-N Phase-Locked-Loop (PLL) with an Integrated Voltage Controlled Oscillator (VCO). The input reference frequency range is 100 kHz to 220 MHz while the advanced delta-sigma modulator design in the fractional PLL allows both ultra-fine step sizes and very low spurious products. The highly integrated structure provides excellent phase noise performance over temperature, shock and process. The HMC783LP6CE is packaged in a leadless QFN 6 x 6 mm surface mount package. The output power is 11 dBm typical, making the HMC783LP6CE ideal for driving the LO port of many of Hittite's Hi Linearity and I/Q mixer products.

For theory of operation and register map refer to the "PLLs w/ Integrated VCO - Microwave VCOs" Operating Guide. To view the [Operating Guide](#), please visit [www.hittite.com](http://www.hittite.com) and choose HMC783LP6CE from the "Search by Part Number" pull down menu.

[1] This pin is not connected internally, however, this pin must be connected to GND to maintain product family pin for pin compatibility.

[2] This pin is not connected internally, however, this pin must be connected to Vcc to maintain product family pin for pin compatibility.

[3] BIAS ref voltage (pin 20) cannot drive an external load, and must be measured with a 10 GOhm meter such as Agilent 34410A; a typical 10 Mohm DVM will read erroneously.

Pins	Equivalent Schematic
Bias	 <p>The schematic shows the Bias pin connected to a network of components. On the left, there is a series combination of a resistor and a capacitor connected to ground. This network is connected to the gate of a MOSFET. The MOSFET's source is connected to ground, and its drain is connected to a resistor leading to the AVDD supply. The Bias pin is connected to the MOSFET's gate through a resistor. Additionally, there are two ESD protection diodes connected to the Bias pin: one to AVDD and one to ground.</p>
REFN, REFP	 <p>The schematic shows the REFN and REFP pins connected to a differential pair of MOSFETs. The gates of both MOSFETs are connected to a common node that is biased by a 1.73V source through a resistor. The gates are also protected by ESD diodes connected to RVDD and ground. The sources of the MOSFETs are connected to ground, and their drains are connected to a common node that is biased by a resistor connected to RVDD. The differential outputs are taken from the drains of the two MOSFETs.</p>

### Evaluation PCB

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
