ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 6 of this data sheet.

Description

The MC10E/100E131 is a quad master-slave D-type flip-flop with differential outputs. Each flip-flop may be clocked separately by holding Common Clock (C_C) LOW and using the Clock Enable ($\overline{CE}$) inputs for clocking. Common clocking is achieved by holding the $\overline{CE}$ inputs LOW and using C_C to clock all four flip-flops. In this case, the $\overline{CE}$ inputs perform the function of controlling the common clock, to each flip-flop.

Individual asynchronous resets are provided (R). Asynchronous set controls (S) are ganged together in pairs, with the pairing chosen to reflect physical chip symmetry.

Data enters the master when both C_C and $\overline{CE}$ are LOW, and transfers to the slave when either C_C or $\overline{CE}$ (or both) go HIGH.

The 100 Series contains temperature compensation.
