

Universal Operational Amplifier Evaluation Module

User's Guide

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.

FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

Introduction

This User's Guide describes a universal operational amplifier (op amp) evaluation module (EVM) that simplifies evaluation of surface-mount op amp.

Topic	Page
1.1 Design Features	1-2
1.2 Power Requirements	1-2

1.1 Design Features

The evaluation module board design allows many different circuits to be constructed easily and quickly. The board has four separate circuit development areas that can be snapped apart and separated. Areas 100 and 200 are for dual op amps in the SOIC and TSSOP/MSOP packages. Areas 300 and 400 are for SOT23–5 single operational amplifier packages. A few possible circuits are listed below:

- Voltage Follower
- Noninverting Amplifier
- Inverting Amplifier
- Simple or Algebraic Summing Amplifier
- Difference Amplifier
- Current-to-Voltage Converter
- Voltage-to-Current Converter
- Integrator/Low-Pass Filter
- Differentiator/High-Pass Filter
- Instrumentation Amplifier
- Sallen-Key Filter

The EVM PCB is of two-layer construction, with a ground plane on the solder side. Circuit performance should be comparable to final production designs.

1.2 Power Requirements

The devices and designs that are used dictate the input power requirements. Three input terminals are provided for each area of the board:

Vx+	Positive input power for area x00	i.e., V1+ ⇒ area 100
GNDx	Ground reference for area x00	i.e., GND2 ⇒ area 200
Vx–	Negative input power for area x00	i.e., V4– ⇒ area 400

Each area has four bypass capacitors, two for the positive supply, and two for the negative supply. Each supply should have a 1- μ F to 10- μ F capacitor for low frequency bypassing and a 0.01- μ F to 0.1- μ F capacitor for high frequency bypassing.

When using single supply circuits, the negative supply is shorted to ground by bridging Cx02 or Cx06, and power input is between Vx+ and GNDx. The voltage reference circuitry is provided for single supply applications that require a reference voltage to be generated.

Evaluation Module Layout

This chapter describes and shows the universal op amp EVM board layout and the relationships between the four areas.

Topic	Page
2.1 Physical Consideration	2-2
2.2 Area 100 – SOIC	2-3
2.3 Area 200 – TSSOP or MSOP	2-4
2.4 Area 300 – SOT23-5A	2-5
2.5 Area 400 – SOT23-5B	2-6
2.6 Component Placement	2-7
2.7 Board Layout	2-8

2.1 Physical Considerations

The EVM board has four circuit development areas. If a specific area is desired, it can be separated from the others by breaking along the score lines. The circuit layout in each area supports an op amp package, voltage reference, and ancillary devices. The op amp package is unique to each area as described in the following paragraphs. The voltage reference and supporting devices are the same for all areas. Surface-mount or through-hole devices can be used for all capacitors and resistors on the board.

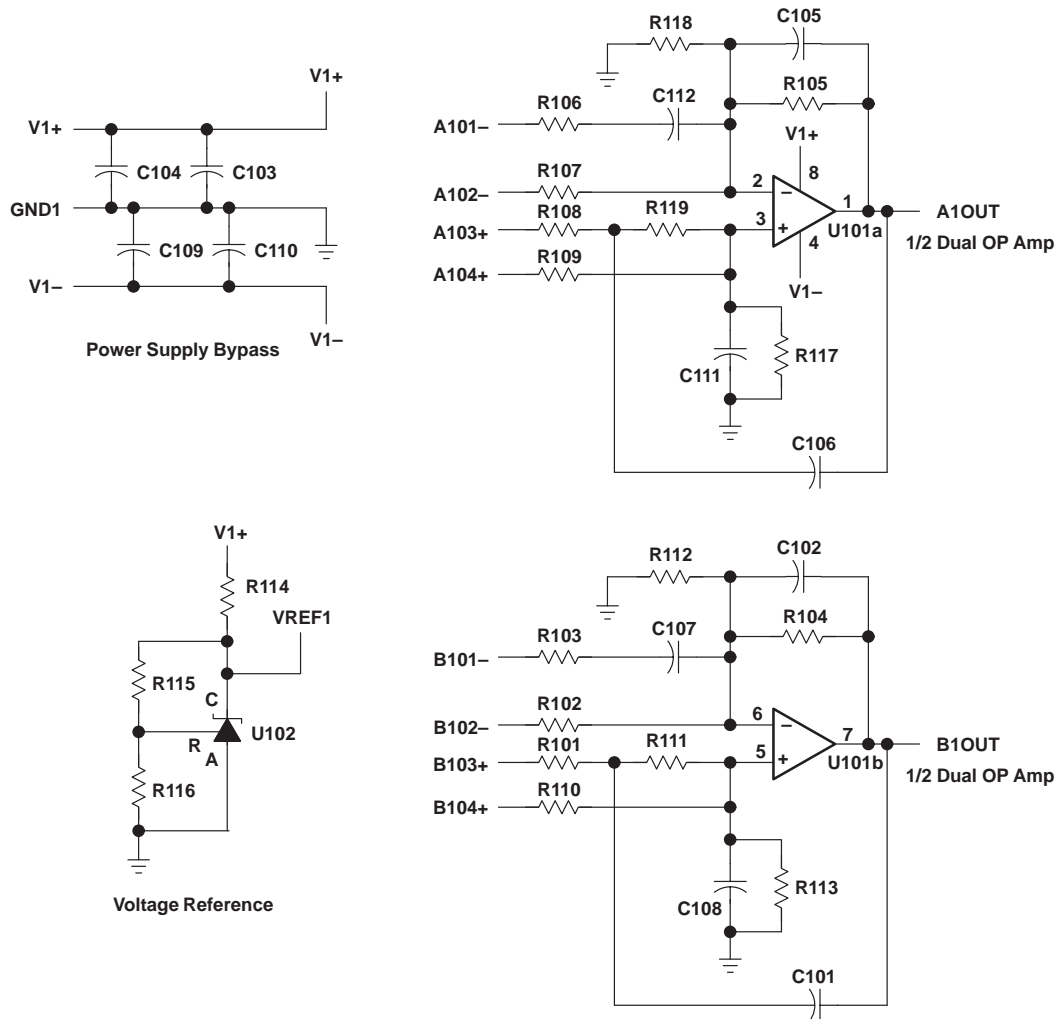

The voltage reference can be either surface mount or through hole. If surface-mount is desired, the TLV431ACDBV5 or TLV431AIDBV5 adjustable shunt regulators can be used. If through hole is desired, then the TLV431ACLP, TLV431AILP, TL431CLP, TL431ACLP, TL431ILP or TL431AILP adjustable shunt regulators can be used. Refer to Texas Instruments' *Power Supply Circuits Data Book* (literature number SLVD002) for details on usage of these shunt regulators.

Each passive component, resistor and capacitor, has a surface-mount 1206 foot print with through holes at 0.2" spacing on the outside of the 1206 pads. Therefore, either surface-mount or through-hole parts can be used.

2.2 Area 100 – SOIC

Area 100 uses 1xx reference designators, and is compatible with dual op amps in 8-pin SOIC packages. Most dual op amps are available in this package. This surface-mount package is designated by a D suffix in TI part numbers as in TLV2422CD, TLV2342ID, TLV2252ID, etc. Refer to Figure 2–1 for a schematic.

Figure 2–1. Area 100 Schematic – SOIC

2.3 Area 200 – TSSOP or MSOP

Area 200 uses 2x reference designators, and is compatible with dual op amps in an 8-pin TSSOP or MSOP package. The TSSOP package is designated by a PW suffix in TI part numbers as in TLV2422CPWLE, TLV2342IPWLE, TLV2252AIPWLE, etc. The MSOP package is designated by a DGK suffix in TI part numbers as in TLV2462CDGK. Refer to Figure 2–2 for a schematic.

Figure 2–2. Area 200 Schematic – TSSOP and MSOP

2.4 Area 300 – SOT23-5A

Area 300 uses 3xx reference designators, and is compatible with single op amps in the 5-pin SOT-23 package with the pinout used for the TLV22X1 as shown in Figure 2–3. This surface-mount package is designated by a DBV suffix in TI part numbers as in TLV2211CDBV, TLV2221CDBV, TLV2361CDBV, TLV2231IDBV, etc. Note: other parts like TLV2771CDBV, TLV2711CDBV, TLV2461CDBV, etc., follow different pin-out schemes, which are not compatible with this layout. See Figure 2–4 for a schematic.

Figure 2–3. TLV22X1 Device Pinout

Figure 2–4. Area 300 Schematic – SOT23-5A

2.5 Area 400 – SOT23-5B

Area 400 uses 4xx reference designators, and is compatible with single op amps in the 5-pin SOT-23 package with the pinout used for the TLV2271CDBV and TLV2461CDBV as shown in Figure 2–5. This surface-mount package is designated by a DBV suffix in TI part numbers as in TLV2771CDBV and TLV2461CDBV. Note: earlier parts like TLV2221CDBV, TLV2231IDBV, TLV2361CDB, and TLV2711CDBV, etc., follow a different pin-out scheme, which is not compatible with this layout. Refer to Figure 2–6 for a schematic.

Figure 2–9. Universal Operational Amplifier EVM Board Layout Bottom

Example Circuits

This chapter shows and discusses several example circuits that can be constructed using the universal operational amplifier EVM. The circuits are all classic designs that can be found in most operational amplifier design books.

Topic	Page
3.1 Schematic Conventions	3-1
3.2 Sallen-Key Low-Pass Filter	3-2
3.3 Sallen-Key High-Pass Filter	3-3
3.4 Inverting Amplifier	3-5
3.5 Noninverting Amplifier	3-6
3.6 Two Operational Amplifier Instrumentation Amplifiers	3-7
3.7 Differential Amplifier	3-9

3.1 Schematic Conventions

Figures 3-1 through 3-6 show schematics for a sampling of circuits that can be constructed on the Universal Operational Amplifier EVM. The components that are placed on the board are shown in bold and unused components are blanked out. Jumpers and other changes are noted. These examples are only a few of the many circuits that can be built on the EVM.

3.3 Sallen-Key High-Pass Filter

Figure 3–2 shows area 200 equipped with a dual operational amplifier configured as a second-order Sallen-Key high-pass filter using single-supply power input.

Basic setup is done by proper choice of resistors R and mR, and capacitors C and nC. Note that capacitors should be used for components R210 and R211, and a resistor for C201. The transfer function for the circuit as shown is:

$$V_{OUT} = V_{IN} \times \left[\frac{-(f/f_0)^2}{1 + (j/Q)(f/f_0) - (f/f_0)^2} \right] + VREF2$$

Where:

$$f_0 = \frac{1}{2\pi \sqrt{m n} RC}$$

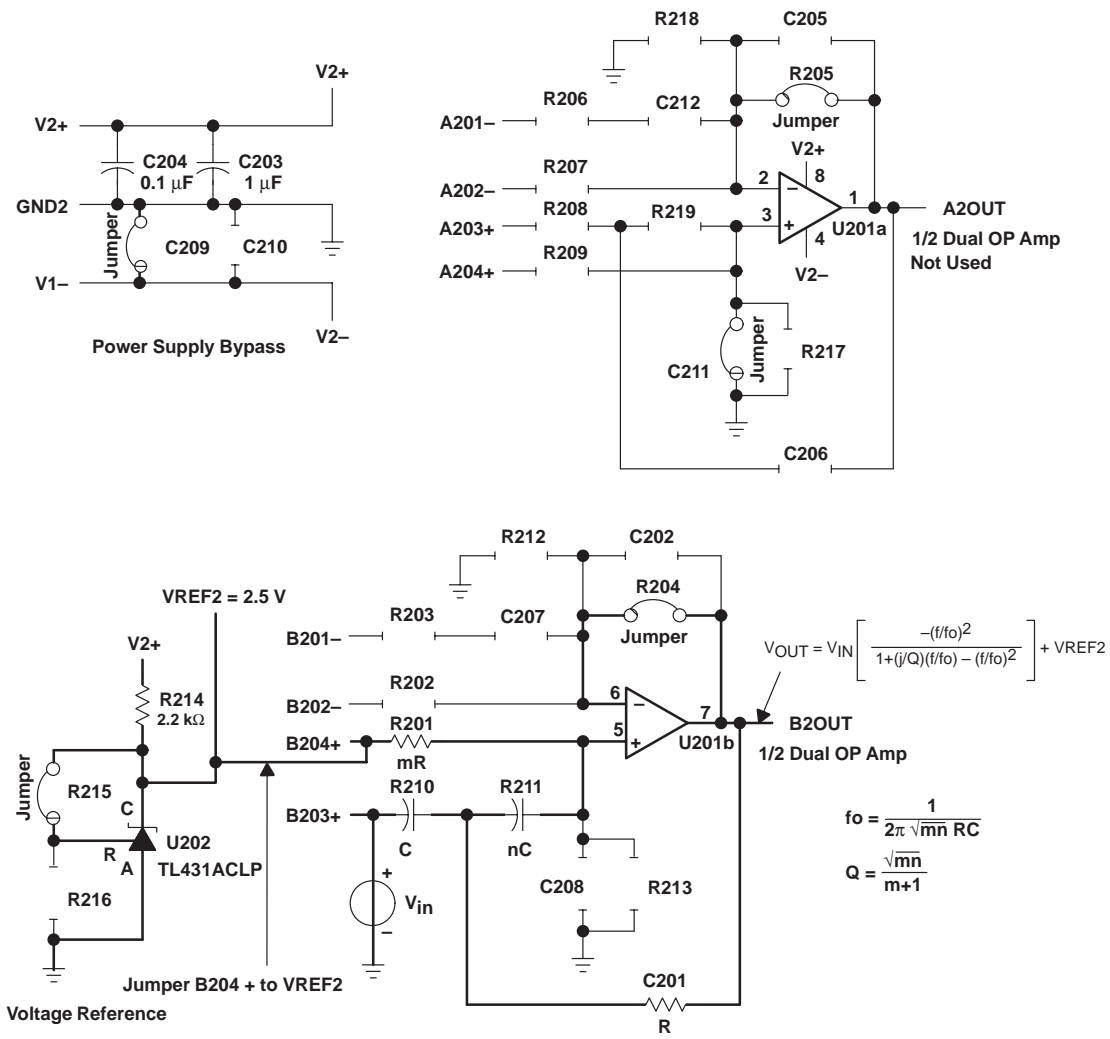

And

$$Q = \frac{\sqrt{m n}}{n + 1}$$

The TL431 adjustable precision shunt regulator, configured as shown, provides a low impedance reference for the circuit at about 1/2 V2+ in a 5 V system. Another option is to adjust resistors R215 and R216 for the desired VREF2 voltage. The formula for calculating VREF2 is:

$$VREF2 = 2.50 V \left(\frac{R215 + R216}{R216} \right)$$

Figure 3–2. Sallen-Key High-Pass Filter with Single Supply Using Area 200

3.4 Inverting Amplifier

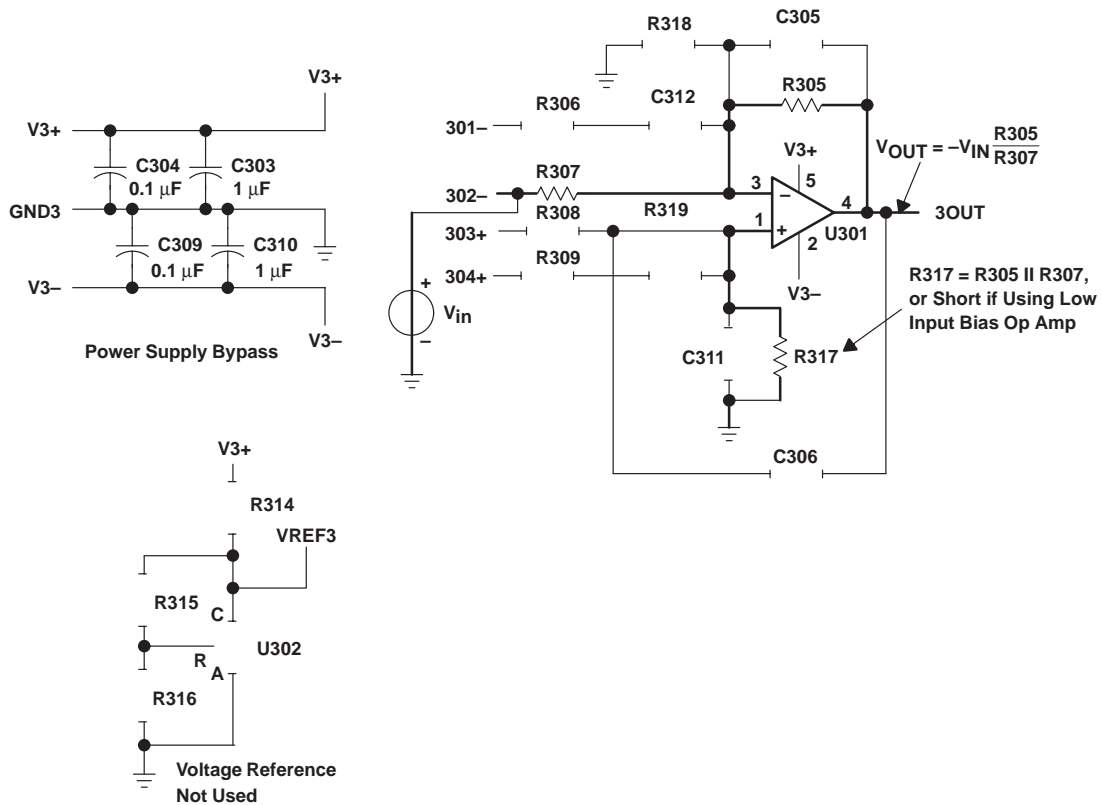

Figure 3–3 shows area 300 equipped with a single operational amplifier configured as an inverting amplifier using dual power supplies. Note the pinout for the operational amplifier in area 300 follows the TLV2211 type pinout.

Basic setup is done by choice of input and feedback resistors. The transfer function for the circuit as shown is:

$$V_{OUT} = -V_{IN} \frac{R_{305}}{R_{307}}$$

To cancel the effects of input bias current, set $R_{317} = R_{305} \parallel R_{307}$, or use a 0Ω jumper for R_{317} if the operational amplifier is a low input bias operational amplifier.

Figure 3–3. Inverting Amplifier with Dual Supply Using Area 300

3.5 Noninverting Amplifier

Figure 3–4 shows area 400 equipped with a single operational amplifier configured as a noninverting amplifier with single supply power input. Note the pinout for the operational amplifier in area 400 follows the TLV2771 type pinout.

Basic setup is done by choice of input and feedback resistors. The transfer function for the circuit as shown is:

$$V_{OUT} = V_{IN} \left(1 + \frac{R_{405}}{R_{407}} \right) + VREF4$$

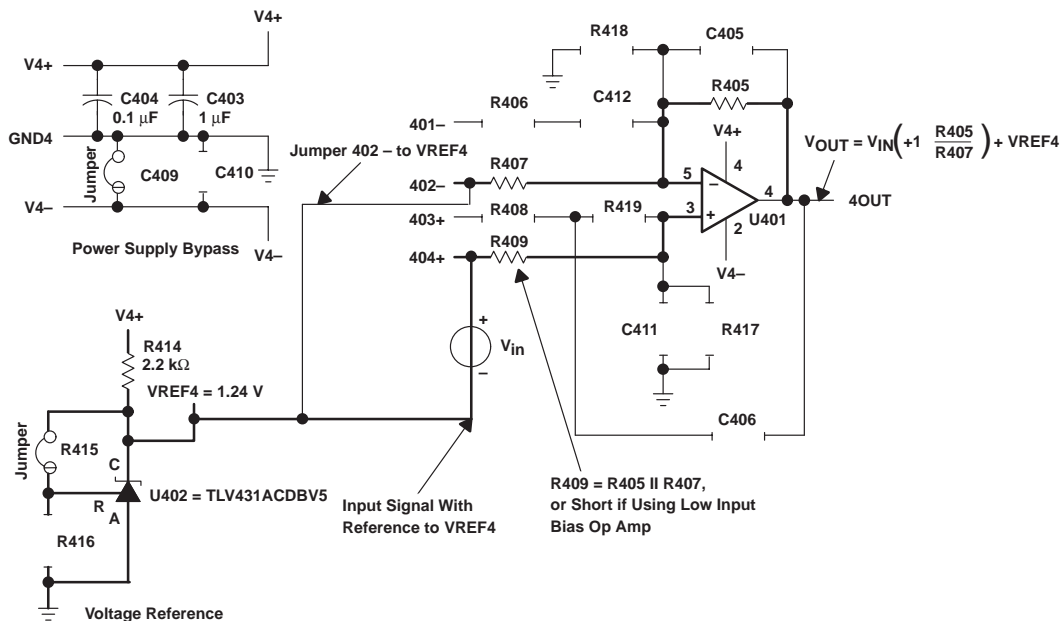

Note that the input signal must be referenced to VREF4.

To cancel the effects of input bias current, set $R_{409} = R_{405} \parallel R_{407}$, or use a 0Ω jumper for R409 if the operational amplifier is a low input bias operational amplifier.

The TL431 adjustable precision shunt regulator, configured as shown, provides a low impedance reference for the circuit at about 1/2 V4+ in a 3 V system. Another option is to adjust resistors R415 and R416 for the desired VREF4 voltage. The formula for calculating VREF4 is:

$$VREF4 = 1.24 V \left(\frac{R_{415} + R_{416}}{R_{416}} \right)$$

Figure 3–4. Non-Inverting Amplifier with Single Supply Using Area 400

3.6 Two Operational Amplifier Instrumentation Amplifier

Figure 3–5 shows area 200 equipped with a dual operational amplifier configured as a two-operational-amplifier instrumentation amplifier using a voltage reference and single power supply.

Basic setup is done by choice of input and feedback resistors. The transfer function for the circuit as shown is:

$$V_{\text{OUT}} = V_{\text{IN}} \left(1 + \frac{2R_{205}}{R_{207}} + \frac{R_{205}}{R_{206}} \right) + V_{\text{REF2}}$$

Where

$$R_{205} = R_{202}$$

and

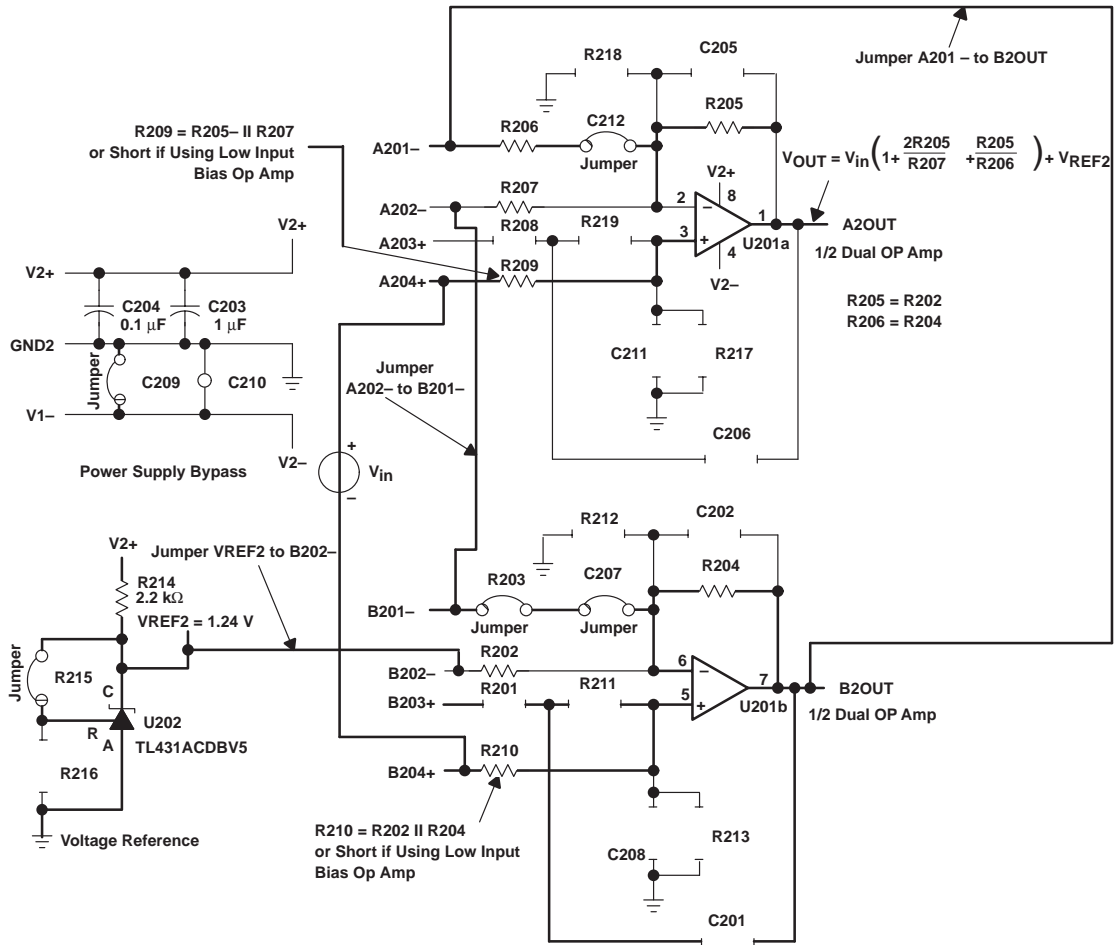

$$R_{206} = R_{204}$$

To cancel the effects of input bias current, set $R_{209} = R_{205} \parallel R_{207}$ and set $R_{210} = R_{202} \parallel R_{204}$, or use a 0Ω jumper for R_{209} and R_{210} if the operational amplifier is a low input bias operational amplifier.

The TLV431 adjustable precision shunt regulator, configured as shown, provides a low impedance reference for the circuit at about $1/2 V_{2+}$ in a 3 V system. Another option is to adjust resistors R_{215} and R_{216} for the desired V_{REF2} voltage. The formula for calculating V_{REF2} is:

$$V_{\text{REF2}} = 1.24 \text{ V} \left(\frac{R_{215} + R_{216}}{R_{216}} \right)$$

Figure 3–5. Two Operational Amplifier Instrumentation Amplifier with Single Supply Using Area 200

3.7 Differential Amplifier

Figure 3–6 shows area 300 equipped with a single operational amplifier configured as a differential amplifier using a voltage reference and single power supply.

Basic setup is done by choice of input and feedback resistors. The transfer function for the circuit as shown is:

$$V_{OUT} = V_{IN} \left(\frac{R_{305}}{R_{307}} \right) + V_{REF3}$$

Where

$$\frac{R_{305}}{R_{307}} = \frac{R_{309}}{R_{308}}$$

The TLV431 adjustable precision shunt regulator, configured as shown, provides a low impedance reference for the circuit at about 1/2 V3+ in a 3 V system. Another option is to adjust resistors R315 and R316 for the desired VREF3 voltage. The formula for calculating VREF3 is:

$$V_{REF3} = 1.24 V \left(\frac{R_{315} + R_{316}}{R_{316}} \right)$$

Figure 3–6. Single Operational Amplifier Differential Amplifier with Single Supply Using Area 300

**Стандарт
Электрон
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
