

MAX3060E/MAX3061E/ MAX3062E

±15kV ESD-Protected, Fail-Safe, 20Mbps, Slew-Rate-Limited RS-485/RS-422 Transceivers in a SOT

General Description

The MAX3060E/MAX3061E/MAX3062E high-speed transceivers for RS-485/RS-422 communication contain one driver and one receiver. These devices feature fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted. This means that the receiver output is a logic high if all transmitters on a terminated bus are disabled (high impedance). These devices also feature hot-swap circuitry that eliminates data glitches during hot insertion.

The MAX3060E features slew-rate-limited drivers that minimize EMI and reduce reflections caused by improperly terminated cables, allowing error-free data transmission up to 115kbps. The MAX3061E, also slew-rate limited, transmits up to 500kbps. The MAX3062E driver is not slew-rate limited, allowing transmit speeds up to 20Mbps. All transmitter outputs are protected to ±15kV using the Human Body Model.

These transceivers typically draw 910μA of supply current when unloaded, or 790μA when fully loaded with the drivers disabled.

All devices have a 1/8-unit-load receiver input impedance that allows up to 256 transceivers on the bus. These devices are intended for half-duplex communication.

Applications

- RS-422/RS-485 Communications
- Level Translators
- Transceivers for EMI-Sensitive Applications
- Industrial-Control Local-Area Networks

Features

- True Fail-Safe Receiver While Maintaining EIA/TIA-485 Compatibility
- Enhanced Slew-Rate Limiting Facilitates
- Error-Free Data Transmission (MAX3060E and MAX3061E)
- 1nA Low-Current Shutdown Mode
- Hot-Swappable for Telecom Applications
- ESD Protection: ±15kV Human Body Model
- Allow Up to 256 Transceivers on the Bus
- Space-Saving 8-Pin SOT23 Package

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX3060EEKA+T	-40°C to +85°C	8 SOT23-8
MAX3061EEKA+T	-40°C to +85°C	8 SOT23-8
MAX3062EEKA+T	-40°C to +85°C	8 SOT23-8

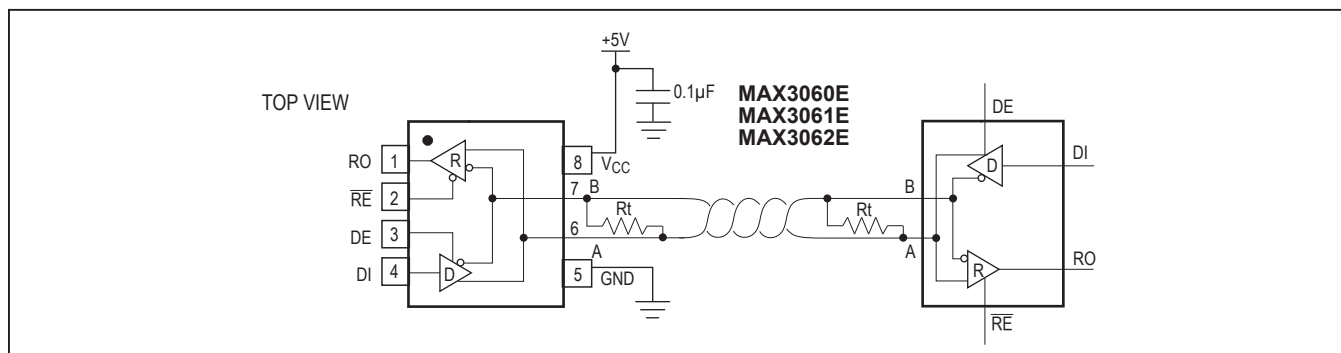

+Denotes a lead-free package.

T = Tape and Reel

Selector Guide

PART	DATA RATE (MBPS)	SLEW-RATE LIMITED	TRANSCEIVERS ON BUS
MAX3060E	0.115	Yes	256
MAX3061E	0.5	Yes	256
MAX3062E	20	No	256

Typical Operating Circuit/Pin Configuration

MAX3060E/MAX3061E/ MAX3062E

±15kV ESD-Protected, Fail-Safe, 20Mbps,
Slew-Rate-Limited RS-485/RS-422
Transceivers in a SOT

Absolute Maximum Ratings

All Voltages with Respect to GND

Supply Voltage (V_{CC})+7V
Input Voltage (\overline{RE} , DE, DI) 0.3V to ($V_{CC} + 0.3V$)
Driver Output/Receiver Input Voltage (A, B) V to +12.5V
Receiver Output Voltage (RO) 0.3V to ($V_{CC} + 0.3V$)
Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)
8-Pin SOT23 (derate 8.9mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)714mW

Operating Temperature Range

MAX306_EE_ -40 $^\circ\text{C}$ to +85 $^\circ\text{C}$
Storage Temperature Range -65 $^\circ\text{C}$ to +150 $^\circ\text{C}$
Junction Temperature +150 $^\circ\text{C}$
Lead Temperature (soldering, 10s) +300 $^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC Electrical Characteristics

($V_{CC} = +5V \pm 5\%$, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $V_{CC} = +5V$ and $T_A = +25^\circ\text{C}$.) (Notes 1, 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
DRIVER

Note 1: Overtemperature limits are guaranteed by design and are not production tested. Devices are tested at $T_A = +25^\circ C$.

Note 2: All currents into the device are positive; all currents out of the device are negative. All voltages are referred to device ground, unless otherwise noted.

Note 3: ΔV_{OD} and ΔV_{OC} are the changes in V_{OD} and V_{OC} , respectively, when the DI input changes state.

Note 4: This input current level is for the hot-swap enable (DE, RE) inputs and is present until the first transition only. After the first transition, the input reverts to a standard high-impedance CMOS input with input current I_{IN1} . For the first 10 μs , the input current can be as high as 1mA. During this period the input is disabled.

Note 5: Maximum current level applies to peak current just prior to foldback-current limiting; minimum current level applies during current limiting.

Note 6: The device is put into shutdown by bringing RE high and DE low. If the enable inputs are in this state for less than 50ns, the device is guaranteed not to enter shutdown. If the enable inputs are in this state for at least 600ns, the device is guaranteed to have entered shutdown.

Pin Description

PIN	NAME	FUNCTION
1	RO	Receiver Output. When \overline{RE} is low and when A - B R -50mV, RO is high; if A - B P -200mV, RO is low. RO is high impedance when \overline{RE} is high.
2	\overline{RE}	Receiver Output Enable. Drive \overline{RE} low to enable RO; RO is high impedance when \overline{RE} is high. Drive \overline{RE} high and DE low to enter low-power shutdown mode. \overline{RE} is a hot-swap input and reverts to a standard CMOS input after the first low transition.
3	DE	Driver Output Enable. Drive DE high to enable driver outputs. Driver outputs are high impedance when DE is low. Drive \overline{RE} high and DE low to enter low-power shutdown mode. DE is a hot-swap input and reverts to a standard CMOS input after the first high transition.
4	DI	Driver Input. With DE high, a low on DI forces the noninverting output low and the inverting output high. Similarly, a high on DI forces the noninverting output high and the inverting output low.
5	GND	Ground
6	A	Noninverting Receiver Input and Noninverting Driver Output
7	B	Inverting Receiver Input and Inverting Driver Output
8	V _{CC}	Positive Supply. Bypass with a 0.1µF capacitor to GND.

Detailed Description

The MAX3060E/MAX3061E/MAX3062E high-speed transceivers for RS-485/RS-422 communication contain one driver and one receiver. These devices feature fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted, or when they are connected to a terminated transmission line with all drivers disabled (see the [Fail-Safe](#) section). All devices have a hot-swap input structure that prevents disturbances on the differential signal lines when a circuit board is plugged into a hot backplane (see the [Hot-Swap Capability](#) section). The MAX3060E features a reduced slew-rate driver that minimizes EMI and reduces reflections caused by improperly terminated cables, allowing error-free data transmission up to 115kbps (see the [Reduced EMI and Reflections](#) section). The MAX3061E is also slew-rate limited, transmitting up to 500kbps. The MAX3062E driver is not slew-rate limited, allowing transmit speeds up to 20Mbps. The MAX3060E/MAX3061E/MAX3062E are half-duplex transceivers.

All of these parts operate from a single +5V supply. Drivers are output short-circuit current limited. Thermal-shutdown circuitry protects drivers against excessive power dissipation. When activated, the thermal-shutdown circuitry places the driver outputs into a high-impedance state.

Receiver Input Filtering

The receivers of the MAX3060E and MAX3061E incorporate input filtering in addition to input hysteresis. This filtering enhances noise immunity with differential signals that have very slow rise and fall times. Receiver propagation delay increases by 2ns due to this filtering.

Fail-Safe

The MAX3060E family of devices guarantee a logic-high receiver output when the receiver inputs are shorted or open, or when they are connected to a terminated transmission line with all drivers disabled. This is done by setting the receiver threshold between -50mV and -200mV. If the differential receiver input voltage (A - B) is greater than or equal to -50mV, RO is logic high. If A - B is less than or equal to -200mV, RO is logic low. In the case of a terminated bus with all transmitters disabled, the receiver's differential input voltage is pulled to 0V by the termination. In the case of an unterminated bus with all transmitters disabled, the receiver's differential input voltage is pulled to 0V by the receiver's input resistors. With the receiver thresholds of the MAX3060E family, this results in a logic high output with a 50mV minimum input noise margin. Unlike previous fail-safe devices, the -50mV to -200mV threshold complies with the ±200mV EIA/TIA-485 standard.

Table 1. Transmitter Functional Table

TRANSMITTING				
INPUTS			OUTPUTS	
RE	DE	DI	B	A
X	1	1	0	1
X	1	0	1	0
0	0	X	High-Z	High-Z
1	0	X	Shutdown*	

X = Don't care.
 *Shutdown mode, driver and receiver outputs are high impedance.

Hot-Swap Capability

Hot-Swap Input

When circuit boards are inserted into a hot or powered backplane, differential disturbances to the data bus can lead to data errors. Upon initial circuit board insertion, the data communication processor undergoes its own power-up sequence. During this period, the processor's logic-output drivers are high impedance and are unable to drive the DE and RE inputs of the MAX306_E to a defined logic level. Leakage currents up to ±10µA from the high-impedance state of the processor's logic drivers could cause standard CMOS enable inputs of a transceiver to drift to an incorrect logic level. Additionally, parasitic circuit board capacitance could cause coupling of VCC or GND to the enable inputs. Without the hot-swap capability, these factors could improperly enable the transceiver's driver or receiver.

When VCC rises, an internal pulldown circuit holds DE low for at least 10µs and until the current into DE exceeds 200µA. After the initial positive transition, the pulldown circuit becomes transparent, resetting the hot-swap tolerable input.

Hot-Swap Input Circuitry

These devices' enable inputs feature hot-swap capability. At the input there are two NMOS devices, M1 and M2 (Figure 10). When VCC ramps from zero, an internal 10µs timer turns on M2 and sets the SR latch, which also turns on M1. Transistors M2, a 300µA current sink, and M1, a 30µA current sink, pull DE to GND through an 8kΩ resistor. M2 is designed to pull DE to the disabled state against an external parasitic capacitance up to 100pF that can drive DE high. After 10µs, the timer deactivates M2

Table 2. Receiver Functional Table

RECEIVING			
INPUTS			OUTPUT
RE	DE	A-B	RO
0	X	R -0.05V	1
0	X	P -0.2V	0
0	X	Open/shorted	1
1	1	X	High-Z
1	0	X	Shutdown

while M1 remains on, holding DE low against three-state leakages that can drive DE high. M1 remains on until an external source overcomes the required input current. At this time, the SR latch resets and M1 turns off. When M1 turns off, DE reverts to a standard, high-impedance CMOS input. Whenever VCC drops below 1V, the hot-swap input is reset.

For RE, there is a complementary circuit employing two PMOS devices pulling RE to VCC.

Figure 10. Simplified Structure of the Driver Enable Input (DE)

Hot-Swap Line Transient

The circuit of Figure 11 shows a typical offset termination used to guarantee a greater than 200mV offset when a line is not driven (the 50pF represents the minimum parasitic capacitance that would exist in a typical application). During a hot-swap event when the driver is connected to the line and is powered up, the driver must not cause the differential signal to drop below 200mV. Figures 12, 13, and 14 show the results of the MAX3060E during power-up for three different V_{CC} ramp rates (0.1V/μs, 1V/μs, and 10V/μs). The photos show the V_{CC} ramp, the single-ended signal on each side of the 100Ω termination, as well as the differential signal across the termination.

±15kV ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against ESD encountered during handling and assembly. The MAX3060E family's receiver inputs/driver outputs (A, B) have extra protection against static electricity found in normal operation. Maxim's engineers developed state-of-the-art structures to protect these pins against ±15kV ESD without damage. After an ESD event, the devices continue working without latchup.

ESD protection can be tested in several ways. The receiver inputs are characterized for protection to the following:

- ±15kV using the Human Body Model
- ±7kV using the Contact Discharge method specified in IEC 1000-4-2 (formerly IEC 801-2)
- ±7kV using the Air-Gap Discharge method specified in IEC 1000-4-2 (formerly IEC 801-2)

ESD Test Conditions

ESD performance depends on a number of conditions. Contact Maxim for a reliability report that documents test setup, methodology, and results.

Human Body Model

Figure 15a shows the Human Body Model, and Figure 15b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the device through a 1.5kΩ resistor.

IEC 1000-4-2

The IEC 1000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to integrated circuits.

The main difference between tests done using the Human Body Model and IEC 1000-4-2 is higher peak current in IEC 1000-4-2. Because series resistance is lower in the IEC 1000-4-2 ESD test model (Figure 16), the ESD withstand voltage measured to this standard is generally lower than that measured using the Human Body Model. The Air-Gap test involves approaching the device with a charged probe. The Contact Discharge method connects the probe to the device before the probe is energized.

Machine Model

The Machine Model for ESD testing uses a 200pF storage capacitor and zero-discharge resistance. It mimics the stress caused by handling during manufacturing and assembly. All pins (not just RS-485 inputs) require this protection during manufacturing. Therefore, the Machine Model is less relevant to the I/O ports than are the Human Body Model and IEC 1000-4-2.

Applications Information

256 Transceivers on the Bus

The standard RS-485 receiver input impedance is 12kΩ (one-unit load), and the standard driver can drive up to 32-unit loads. The MAX3060E family of transceivers have a 1/8-unit-load receiver input impedance (96kΩ), allowing up to 256 transceivers to be connected in parallel on one communication line. Any combination of these devices and/or other RS-485 transceivers with a total of 32 unit loads or less can be connected to the line.

Reduced EMI and Reflections

The MAX3060E and MAX3061E are slew-rate limited, minimizing EMI and reducing reflections caused by improperly terminated cables. Figure 17 shows the driver output waveform and its Fourier analysis of a 25kHz

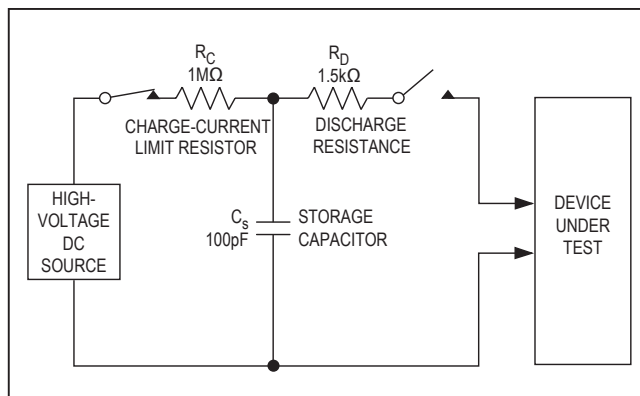

Figure 15a. Human Body ESD Test Model

Figure 15b. Human Body Current Waveform

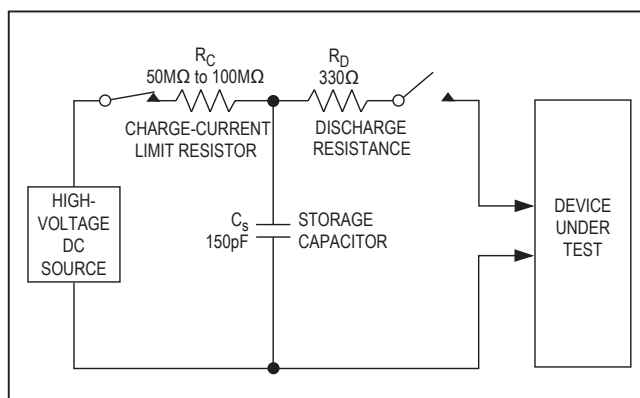

Figure 16. IEC 1000-4-2 ESD Test Model

signal transmitted by a MAX3062E. High-frequency harmonic components with large amplitudes are evident. Figure 18 shows the same signal displayed for a MAX3061E transmitting under the same conditions.

Figure 18's high-frequency harmonic components are much lower in amplitude, compared with Figure 17's, and the potential for EMI is significantly reduced. Figure 19 shows the same signal displayed for a MAX3060E transmitting under the same conditions. Figure 19's high-frequency harmonic components are even lower.

In general, a transmitter's rise time relates directly to the length of an unterminated stub, which can be driven with only minor waveform reflections. The following equation expresses this relationship conservatively:

$$\text{Length} = t_{\text{RISE}} / (10 \times 1.5\text{ns/ft})$$

where t_{RISE} is the transmitter's rise time.

For example, the MAX3060E's rise time is typically 1850ns, which results in excellent waveforms with a stub length up to 123ft. A system can work well with longer unterminated stubs, even with severe reflections, if the waveform settles out before the UART samples them.

Low-Power Shutdown Mode

Low-power shutdown mode is initiated by bringing both $\overline{\text{RE}}$ high and DE low. In shutdown, the devices typically draw only 1nA of supply current.

$\overline{\text{RE}}$ and DE can be driven simultaneously. The parts are guaranteed not to enter shutdown if $\overline{\text{RE}}$ is high and DE is low for less than 50ns. If the inputs are in this state for at least 600ns, the parts are guaranteed to enter shutdown.

Enable times t_{ZH} and t_{ZL} in the *Switching Characteristics* tables assume the part was not in a lowpower shutdown state. Enable times $t_{\text{ZH}}(\text{SHDN})$ and $t_{\text{ZL}}(\text{SHDN})$ assume the parts were shut down. It takes drivers and receivers longer to become enabled from low-power shutdown mode ($t_{\text{ZH}}(\text{SHDN})$, $t_{\text{ZL}}(\text{SHDN})$) than from driver/receiver-disable mode (t_{ZH} , t_{ZL}).

Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or by bus contention. The first, a foldback current limit on the output stage, provides protection after a 20μs delay against short circuits over the whole common-mode voltage range (see [Typical Operating Characteristics](#)). The second, a thermal shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature becomes excessive.

Typical Applications

The MAX3060E family of transceivers are designed for bidirectional data communications on multipoint bus transmission lines. Figure 20 shows a typical network application circuit.

To minimize reflections, the line should be terminated at both ends in its characteristic impedance, and stub lengths off the main line should be kept as short as possible. The slew-rate-limited MAX3060E and MAX3061E are more tolerant of imperfect termination.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
