DESCRIPTION

The SFH6315/16/43, high speed optocouplers, each consists of a GaAlAs infrared emitting diode, optically coupled with an integrated photodetector and a high speed transistor. The photodetector is junction isolated from the transistor to reduce miller capacitance effects. The open collector output function allows circuit designers to adjust the load conditions when interfacing with different logic systems such as TTL, CMOS, etc.

Because the SFH6343 has a Faraday shield on the detector chip, it can also reject and minimize high input to output common mode transient voltages. There is no base connection, further reducing the potential electrical noise entering the package.

The SFH6315/16/43 are packaged in industry standard SOIC-8 packages and are suitable for surface mounting.

Notes

- Current transfer ratio in percent equals the ratio of output collector current (I_O) to the forward LED input current (I_F) times 100.
- Device considered a two-terminal device: pins 1, 2, 3, and 4 shorted together and pins 5, 6, 7, and 8 shorted together.
- Common mode transient immunity in a Logic High level is the maximum tolerable (positive) dV_{CM}/dt on the leading edge of the common mode pulse (V_{CM}) to assure that the output will remain in a Logic High state (i.e., $V_O > 2.0\text{ V}$). Common mode transient immunity in a Logic Low level is the maximum tolerable (negative) dV_{CM}/dt on the trailing edge of the common mode pulse signal (V_{CM}) to assure that the output will remain in a Logic Low state (i.e., $V_O < 0.8\text{ V}$).
- The $1.9\text{ K}\Omega$ load represents 1 TTL unit load of 1.6 mA and the $5.6\text{ k}\Omega$ pull-up resistor.
- The $4.1\text{ K}\Omega$ load represents 1 LSTTL unit load of 0.36 mA and the $6.1\text{ k}\Omega$ pull-up resistor.
- A $0.1\text{ }\mu\text{F}$ bypass capacitor connected between pins 5 and 8 is recommended.
