## Introduction

This document describes the features and hardware details of the CPU Board XMC4400 General Purpose (CPU\_44A-V2) designed to work with Infineon's XMC4400 Microcontroller. This board is part of Infineon's Hexagon Application Kits.

## 1 Overview

The CPU board CPU\_44A-V2 houses the XMC4400 Microcontroller and three satellite connectors (HMI, COM, ACT) for application expansion. The board along with satellite cards (e.g. HMI\_OLED-V1, COM\_ETH-V1, AUT\_ISO-V1 boards) demonstrates the capabilities of the XMC4400. The main use case for this board is to demonstrate the generic features of the XMC4400 device including tool chain. The focus is safe operation under evaluation conditions. The board is neither cost nor size optimized and does not serve as a reference design.

### 1.1 Key Features

The CPU\_44A-V2 board is equipped with the following features

- XMC4400 (ARM<sup>®</sup> Cortex™-M4-based) Microcontroller, 512 kByte on-chip Flash, LQFP-100
- Connection to satellite cards via the satellite connectors COM, HMI and ACT
- USB OTG Host/Device support via micro USB connector
- Debug options
  - On-board Debugger via the Debug USB connector
  - Cortex Debug connector 10-pin (0.05")
  - Cortex Debug+ETM connector 20-pin (0.05")
- Reset push button
- RGB LED connected to GPIOs P1.10, P1.11 and P5.7
- Boot option switch
- PowerScale Connector: Ready for power consumption analysis
- 7 LED's
  - 3 Power indicating LEDs
  - 2 User LEDs (P5.2 and P1.8)
  - 1 RESET LED
  - 1 Debug LED
- Two User Buttons connected to HIB\_IO\_0 and P0.10
- Potentiometer, connected to analog input P14.1
- Power supply
  - Via Micro-USB connector in USB device mode
  - Via satellite connector pins (COM/ACT satellites cards can supply power to CPU board)
  - Via Debug USB connector
  - RTC backup battery

## 1.2 Block Diagram

Figure 1 shows the functional block diagram of the CPU\_44A-V2 board. For more information about the power supply please refer to chapter 2.1.

The CPU board has got the following building blocks:

- 3 Satellite Connectors (COM, HMI ACT)
- 2 User LEDs connected to GPIOs P5.2 and P1.8
- 2 User Buttons connected to HIB\_IO\_0 and P0.10
- RGB LED connected to GPIOs P1.10, P1.11 and P5.7
- 2 Cortex Debug Connectors
- Variable resistor (POTI) connected to GPIO P14.1
- USB On-The-Go Connector (Micro-USB)
- On-board Debugger via Debug USB connector (Micro-USB)

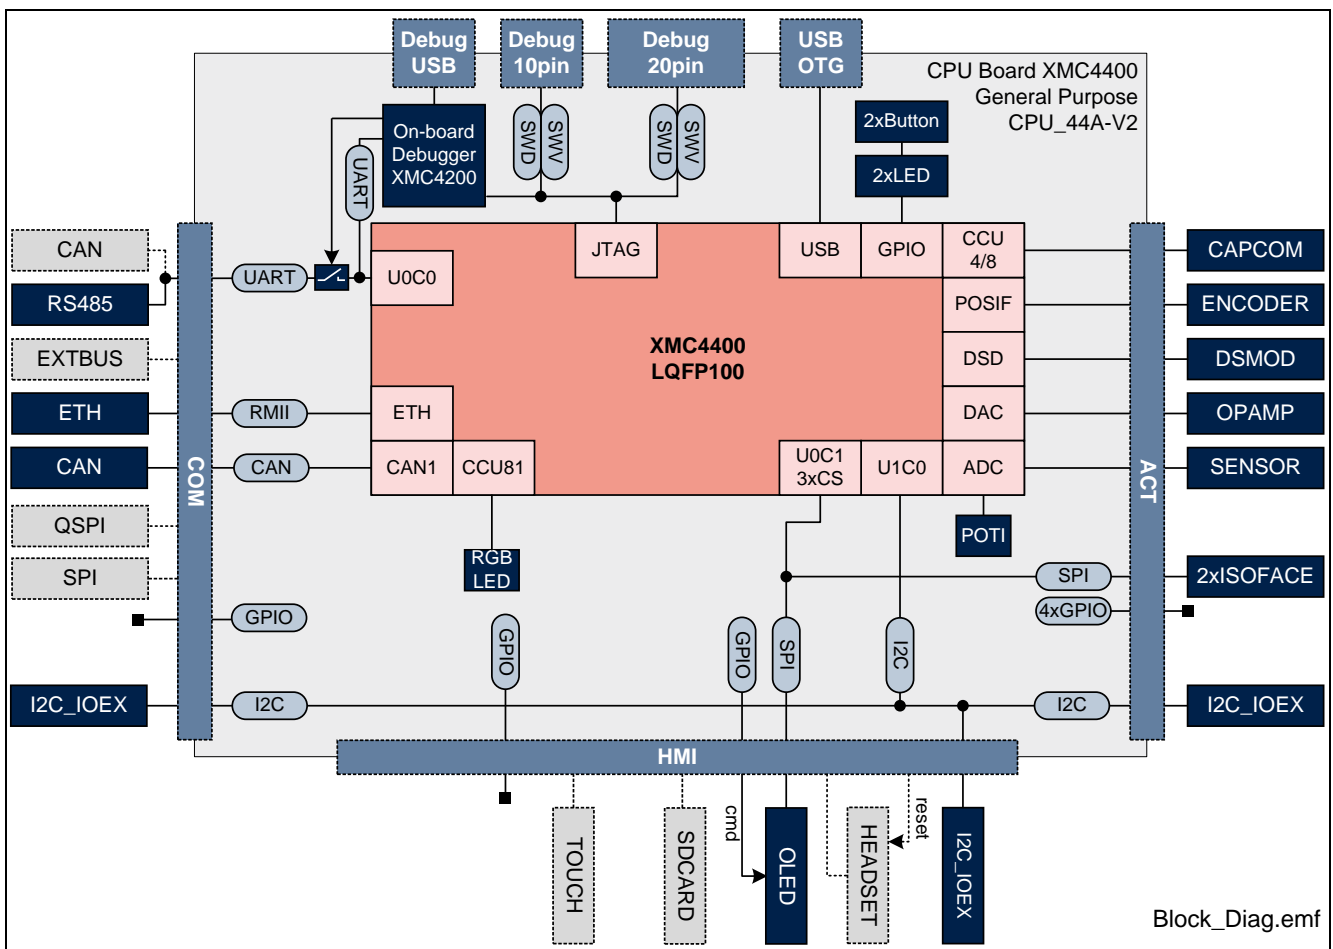

Figure 1 CPU\_44A-V2 Board Block Diagram

## 2 Hardware Description

The following sections give a detailed description of the hardware and how it can be used.

Figure 2 CPU Board XMC4400 General Purpose (CPU\_44A-V2)

### 2.1 Power Supply

The CPU\_44A-V2 board can be powered via either of the USB plugs (5 V); however, there is a current limit that can be drawn from the host PC through USB. If the CPU\_44A-V2 board is used to drive other satellite cards e.g. MOT\_GPDLV-V2 and the total system current required exceeds 500 mA, then the CPU\_44A-V2 board needs to be powered by a satellite cards. These satellite cards support external power supply.

The typical current drawn by the CPU board without any satellite cards connected is about 190 mA (@5 V).

For powering the board through an USB interface, connect the USB cable provided with the kit to either of the Micro-USB connector on board as shown in Figure 3.

Figure 3 Powering Option

To indicate the power status of the CPU\_44A-V2 board three power indicating LED's are provided on board (see Figure 3). The LED will be "ON" when the corresponding power rail is powered.

Table 1 Power status LED's

LED Reference	Power Rail	Voltage	Note
V401	VDD5	5 V	Must always be "ON"
V402	VDD5USB	5 V	"ON" if powered by USB OTG connector X203 "OFF" in all other supply cases
V403	VDD3.3	3.3 V	Must always be "ON"

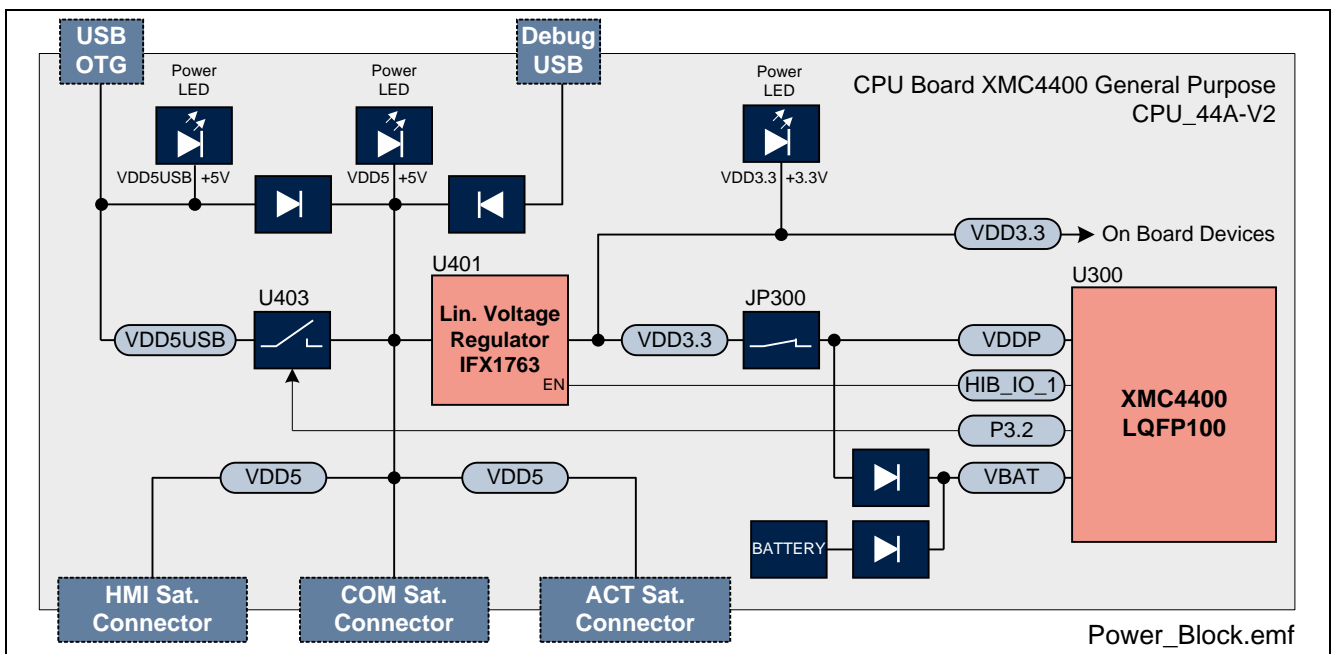

Figure 4 Block Diagram Of Power Supply

Hitex PowerScale probe is provided on the CPU\_44A-V2 board to measure the power consumption of the XMC4400 device.

**Table 2 Power Measurement**

Jumper	Function	Description
JP300	PowerScale	A Hitex PowerScale probe can be connected for current sensing the VDD3.3 (CPU power source). Default: pos. 1-2 (closed) <i>Note: On the PCB there is a shorting trace between pin 1-2. This trace has to be cut first, before using PowerScale. Pin 3 is GND.</i>

## 2.2 Reset

A reset signal connected to the low-active PORST# pin of the target CPU (U300) can be issued by

- an on-board Reset Button (SW400, RESET)
- an on-board debug device (U500)
- an external debugger connected to either Cortex Debug connector X400 or X401

The RESET signal is routed to all satellite connectors. The reset circuit includes a red LED (V407) to indicate the reset status: The Reset LED (V407) will be "ON" during active reset state and will be "OFF" if reset is not active.

Be aware that PORST# is a bidirectional reset pin of the XMC4000 family which can also be pulled low by the XMC4000 device itself.

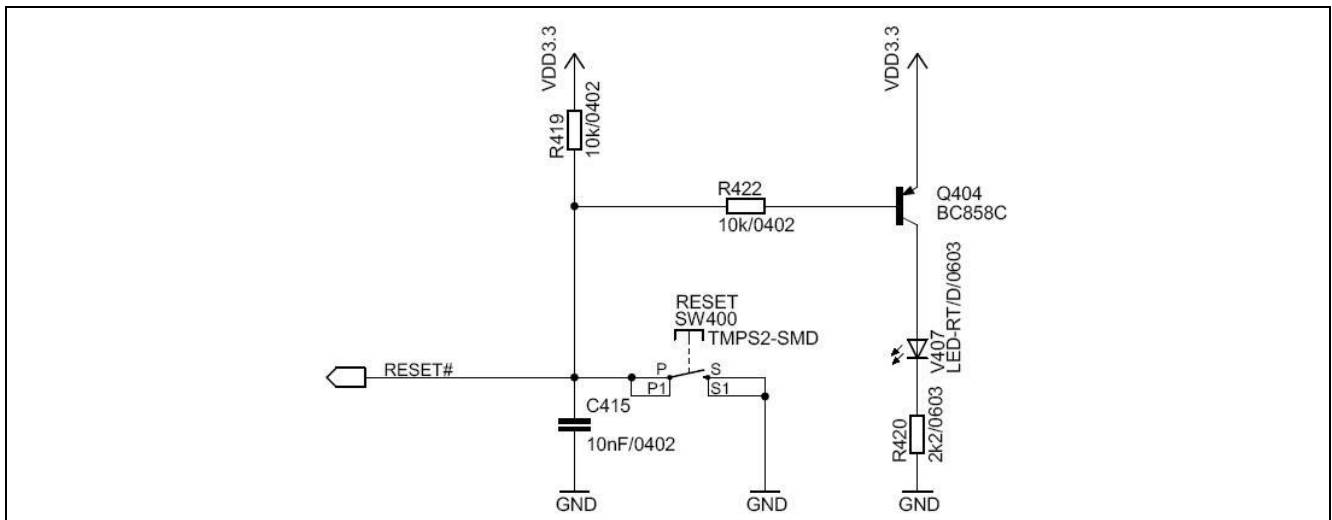

Figure 5 Reset Circuit

Figure 6 Reset LED and Reset Button

### 2.3 Clock Generation

An external 12 MHz crystal provides the clock signal to the XMC4400 microcontroller. The drive strength of the oscillator is set to maximum by software, in order to ensure a safe start-up of the oscillator even under worst case conditions. Therefore a serial 510 Ohm resistor will attenuate the oscillations during operations.

For the RTC clock a separate external 32.768 kHz crystal is used on board.

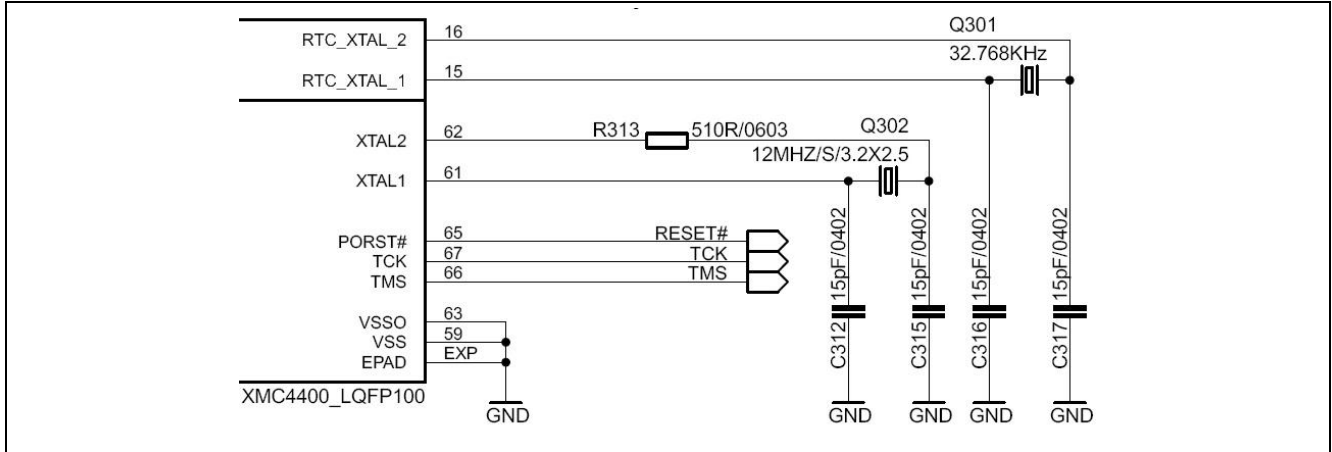

Figure 7 Clock Generation

### 2.4 Boot Option

During power-on-reset the XMC4400 latches the dip switch SW300 settings via the TCK and the TMS pin. Based on the values latched different boot options are possible.

Table 3 Boot Options Settings

BSL (TMS)	CAN/UART (TCK)	Boot Option
OFF (1)	UART (0)	Normal Mode (Boot from flash)
ON (0)	UART (0)	ASC BSL Enabled (Boot from UART)
OFF (1)	CAN (1)	BMI Customized Boot Enabled
ON (0)	CAN (1)	CAN BSL Enabled (Boot from CAN)

Figure 8 Boot Options Switch

## 2.5 Debug Interface

The CPU\_44A-V2 board supports debugging via 3 different channels:

- On-board Debugger
- Cortex Debug Connector (10-pin)
- Cortex Debug+ETM Connector (20-pin)

The Hexagon Application Boards are designed to use “Serial Wire Debug” as debug interface. JTAG debug is not supported by default because the GPIO P0.7, where the required TDI function is mapped to also, is used by various Actuator boards connected to the ACT satellite connector.

*Note: It is strongly recommended not to use JTAG debug mode, especially if satellites boards are connected, which uses the GPIO 0.7. For the same reason also do not use the on-board debugger in JTAG mode.*

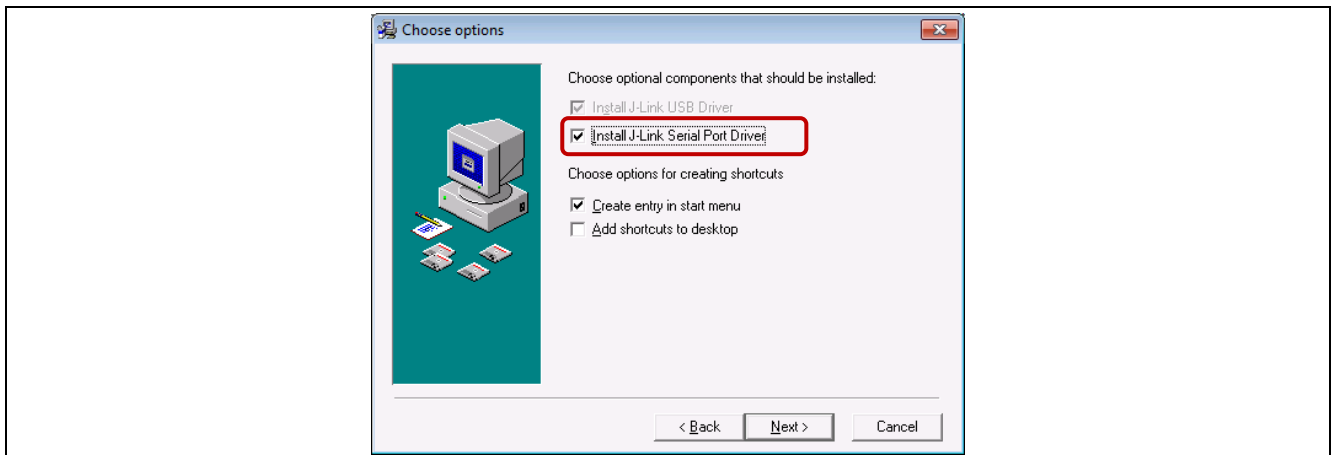

If you want to use the JTAG debug mode through the cortex debug connectors (X400, X401) anyway, enable the JTAG interface of the XMC device by assembling the pull-up resistor R427 (4k7 Ohm) and the resistor R410 (0 - 33 Ohm).

### 2.5.1 On-board USB Debugger

The on-board debugger [1] supports

- Serial Wire Debug
- Serial Wire Viewer
- Full Duplex UART communication via a USB Virtual COM

[1] Attention: Newer firmware versions of the on-board debugger require the latest J-Link driver (V4.62 or higher) and a Serial Port Driver (CDC driver) installed on your computer. Please check “Install J-Link Serial Port Driver” when installing the latest J-Link driver (see Figure 9)

**Figure 9 Installation of Serial Port Driver**

The on-board debugger can be accessed through the Debug USB connector shown in Figure 10. The Debug LED V502 shows the status during debugging.

**Figure 10 On-Board USB Debugger**

When using an external debugger connected to the 10pin/20pin Cortex Debug Connector, the on-board debugger is switched off.

When using the USB virtual COM port function of the on-board debugger the UART interface to the COM satellite is disabled through the switches U301 and U303.

### 2.5.2 Cortex Debug Connector (10-pin)

The CPU\_44A-V2 board supports Serial Wire Debug operation and Serial Wire Viewer operation (via the SWO signal when Serial Wire Debug mode is used) through the 10-pin Cortex Debug Connector.

Figure 11 Cortex Debug Connector (10-pin)

Table 4 Cortex Debug Connector (10 Pin)

Pin No.	Signal Name	Serial Wire Debug	JTAG Debug
1	VCC	+3.3 V	+3.3 V
2	SWDIO / TMS	Serial Wire Data I/O	Test Mode Select
3	GND	Ground	Ground
4	SWDCLK / TCK	Serial Wire Clock	Test Clock
5	GND	Ground	Ground
6	SWO / TDO	Trace Data OUT	Test Data OUT
7	KEY	KEY	KEY
8	NC / TDI	Not connected	Test Data IN
9	GNDDetect	Ground Detect	Ground Detect
10	nRESET	Reset (Active Low)	Reset (Active Low)

Figure 12 Cortex Debug Connector (10-pin) Layout

### 2.5.3 Cortex Debug+ETM Connector (20-pin)

The CPU\_44A-V2 board supports Serial Wire Debug operation, Serial Wire Viewer operation (via SWO connection when Serial Wire Debug mode is used) through the 20-pin Cortex Debug+ETM Connector. The board does not support the Instruction Trace operation.

JTAG Debug operation additionally would require the TDI (P0.7) signal. By default the TDI signal is disconnected from the Cortex Debug Connectors by a not assembled resistor R410, because the pin P0.7 is used by some Actuator boards connected to the ACT satellite connector.

**Figure 13 Cortex Debug+ETM Connector (20-pin)**

**Table 5 Cortex Debug+ETM Connector (20 Pin)**

Pin No.	Signal Name	Serial Wire Debug	JTAG Debug
1	VCC	+3.3 V	+3.3 V
2	SWDIO / TMS	Serial Wire Data I/O	Test Mode Select
3	GND	Ground	Ground
4	SWDCLK / TCK	Serial Wire Clock	Test Clock
5	GND	Ground	Ground
6	SWO / TDO	Trace Data OUT	Test Data OUT
7	KEY	KEY	KEY
8	NC / TDI	Not connected	Test Data IN
9	GNDDetect	Ground Detect	Ground Detect
10	nRESET	Reset (Active Low)	Reset (Active Low)
11	GND/TgtPwr+Cap	Ground	Ground
12	TRACECLK*	TRACECLK*	TRACECLK*
13	GND/TgtPwr+Cap	Ground	Ground
14	TRACEDATA[0]*	TRACEDATA[0]*	TRACEDATA[0]*
15	GND	Ground	Ground

**Table 5 Cortex Debug+ETM Connector (20 Pin)**

Pin No.	Signal Name	Serial Wire Debug	JTAG Debug
16	TRACEDATA[1]*	TRACEDATA[1]*	TRACEDATA[1]*
17	GND	Ground	Ground
18	TRACEDATA[2]*	TRACEDATA[2]*	TRACEDATA[2]*
19	GND	Ground	Ground
20	TRACEDATA[3]*	TRACEDATA[3]*	TRACEDATA[3]*

Note: \* Not connected on the CPU\_44A-V2 board.

**Figure 14 Cortex Debug+ETM Connector (20-pin) Layout**

## 2.6 RGB LED

The CPU\_44A-V2 board has a tricolored LED. The LED glows with either Red/Blue/Green colors as controlled by the GPIO pins given below.

**Table 6 RGB LED Connections**

Pin No. / Function	LED Color
P5.7 / CCU81.OUT02	RED
P1.11 / CCU81.OUT11	GREEN
P1.10 / CCU81.OUT21	BLUE

**Figure 15 RGB LED**

## 2.7 USB

The XMC4400 supports USB interface in host only mode, device only mode or as an OTG Dual Role Device (DRD). In USB device mode, power is expected through VBUS (pin 1 of X203C) from an external host (e.g. PC). When the current consumption of the application running on the Hexagon Application system is higher than 500 mA, power from an external source through satellite cards shall be used.

*Note: Some PCs, notebooks or hubs have a weak USB supply which is not sufficient for proper supply. In this case use an external 5 Volt power supply or a powered USB hub.*

**Figure 16 USB Connector**

USB ID pin of the USB connector (pin 4 of X203C) is connected to the port pin P0.9 of the XMC4400. On this port pin the USD identification signal (USB.ID) of XMC4000 USB module is mapped to. An OTG device will detect whether a USB Micro-A or Micro-B plug is inserted by checking the ID pin. When the ID = FALSE a Micro-A connector is plugged in and when ID = TRUE a Micro-B connector is plugged in. When the ID is true the XMC4400 acts as a USB host else as a USB device.

**Table 7 USB micro AB connector Pinot**

Pin No.	Pin Name	Pin Description
1	VBUS	5 V
2	D-	Data Minus
3	D+	Data Plus
4	ID	Identification
5	GND	Ground

**Figure 17 USB power generation - Host/OTG mode**

In the host only mode and OTG mode the CPU\_44A-V2 board is capable of supplying power to the connected device (e.g. USB mouse). The board has a power-switch which is controlled by the USB.BUSDRIVE signal of the XMC4400. The USB.BUSDRIVE signal is mapped to port pin P3.2 (active high).

In the Host/OTG mode a low active FAULT signal indicates to the port pin P3.1 of the XMC4400, if more than 500 mA current is drawn by the external device.

Diode V400 will allow powering the board through USB in all USB modes via e.g. a PC.

## 2.8 RTC

The XMC4400 CPU has two power domains, the Core Domain and Hibernate Domain.

The Core Domain (VDDP pins) is connected to the VDD3.3 rail. An on-board LDO voltage regulator generates VDD3.3 (3.3 V) from VDD5 (5 V).

The Hibernate Domain is powered via the auxiliary supply pin VBAT, which is supplied by either a 3 V coin cell (size 1216, 1220, 1225) plugged into the battery holder or 3.3 V (VDD3.3) generated by the on-board voltage regulator.

Figure 18 Battery Holder for Coin Cells

The Real Time Clock (RTC) is located in the hibernate domain. The XMC4400 uses the HIB\_IO\_1 signal (active low) to shut down the external LDO voltage regulator which generates the VDD3.3 (Core Domain). Even if the Core Domain is not powered the Hibernate Domain will operate if VBAT is available. The RTC keeps running as long as the Hibernate Domain is powered via the auxiliary supply VBAT. The RTC is capable to wake-up the whole system from Hibernate mode by setting HIB\_IO\_1 to high.

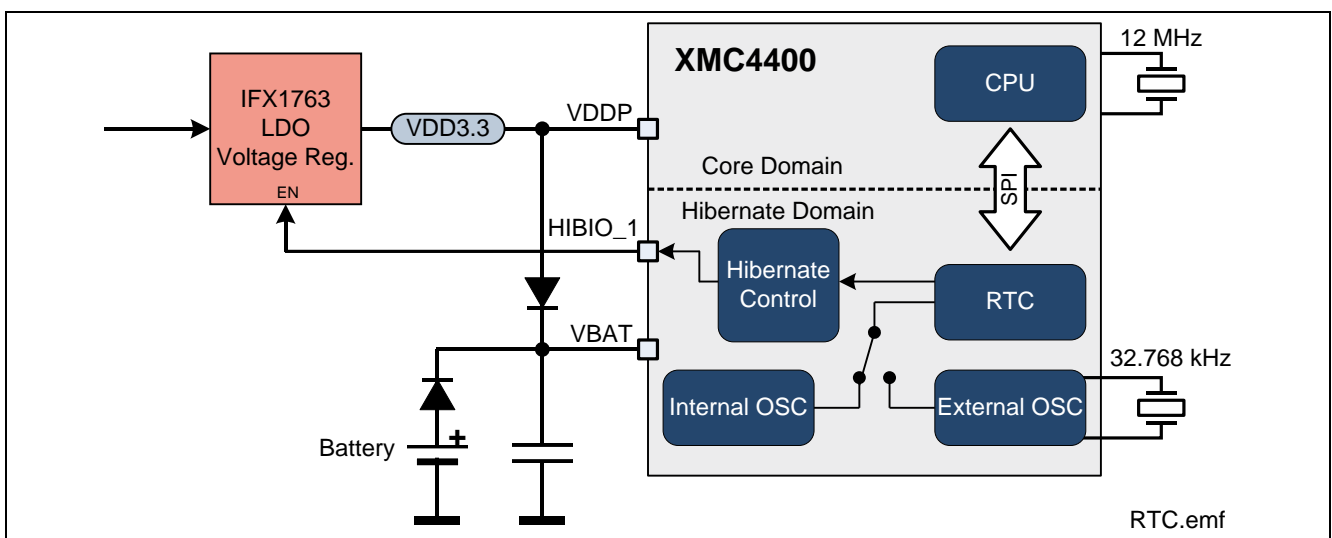

Figure 19 XMC4400 Power Domains and Real Time Clock

## 2.9 User LEDs and User Buttons

The port pins P5.2 and P1.8 of the XMC4400 are connected to the LEDs V300 and V301 respectively. More User LED's are available through the I2C GPIO expander on most of the satellite cards.

**Table 8 User LEDs**

LED	Connected to Port Pin
V300	GPIO P5.2
V301	GPIO P1.8

Two User Buttons, SW301 and SW302 are connected to P0.10 and HIB\_IO\_0 of XMC4400.

**Table 9 User Buttons**

Button	Connected to Port Pin
BUTTON1 / SW301	HIB_IO_0
BUTTON2 / SW302	P0.10

**Figure 20 User LEDs and User Buttons**

## 2.10 Potentiometer

The CPU\_44A-V2 board provides a potentiometer POT1 for ease of use and testing of the on-chip analog to digital converter. The potentiometer is connected to the analog input G0\_CH1 (P14.1). The analog output of the potentiometer ranges from 0 V to 3.3 V.

**Table 10 Potentiometer**

Potentiometer	Connected to Port Pin
R300	P14.1 / G0_CH1 (Group 0, channel 1)

## 2.11 Satellite Connectors

The CPU\_44A-V2 board provides three satellite connectors for application extension by satellite cards:

- COM satellite connector (Communication)
- HMI satellite connector (Human Machine Interface)
- ACT satellite connector (Actuator)

*Note: Satellite cards shall be connected to their matching satellite connectors only. (For e.g. COM satellite cards shall be connected to COM satellite connector only)*

Figure 21 Satellite Connectors

**Figure 24 Satellite Connector Type ACT**

- (1) P0.7 can also be used for JTAG Debugging (TDI)
- (2) P0.8 is used as TRST in order to enable JTAG Debug
- (3) This pin is connected with the satellite connector via an analog switch
- (4) This ADC input does not support "Out of Range Detection"
- (5) This pin must be "enabled" by a solder jump.
- (6) Support High Resolution PWM

## 3 Production Data

### 3.1 Schematics

This chapter contains the schematics for the CPU board:

- Satellite Connectors, USB-OTG
- XMC4400
- Power, Debug Connectors, Reset
- On-board Debugger

The board has been designed with Eagle. The full PCB design data of this board can also be downloaded from [www.infineon.com/xmc-dev](http://www.infineon.com/xmc-dev).

**Стандарт  
Электрон  
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
