

TLE9250X

High Speed CAN FD Transceiver

1 Overview

Qualified for Automotive Applications according to AEC-Q100

Features

- Fully compliant to ISO 11898-2 (2016) and SAE J2284-4/-5
- Reference device and part of Interoperability Test Specification for CAN Transceiver
- Guaranteed loop delay symmetry for CAN FD data frames up to 5 MBit/s
- Very low electromagnetic emission (EME) allows the use without additional common mode choke
- V_{IO} input for voltage adaption to the μC interface (3.3V & 5V)
- Wide common mode range for electromagnetic immunity (EMI)
- Excellent ESD robustness +/-8kV (HBM) and +/-11kV (IEC 61000-4-2)
- Extended supply range on the V_{CC} and V_{IO} supply
- CAN short circuit proof to ground, battery, V_{CC} and V_{IO}
- TxD time-out function
- Very low CAN bus leakage current in power-down state
- Overtemperature protection
- Protected against automotive transients according ISO 7637 and SAE J2962-2 standards
- Receive-only mode
- Green Product (RoHS compliant)
- Small, leadless TSON8 package designed for automated optical inspection (AOI)
- AEC Qualified

Potential applications

- Engine Control Unit (ECUs)
- Electric Power Steering
- Transmission Control Units (TCUs)
- Chassis Control Modules

Overview

Description

Type	Package	Marking
TLE9250XLE	PG-TSON-8	9250X
TLE9250XSJ	PG-DSO-8	9250X

The TLE9250X is the latest Infineon high-speed CAN transceiver generation, used inside HS CAN networks for automotive and also for industrial applications. It is designed to fulfill the requirements of ISO 11898-2 (2016) physical layer specification and respectively also the SAE standards J1939 and J2284.

The TLE9250X is available in a PG-DSO-8 package and in a small, leadless PG-TSON-8 package. Both packages are RoHS compliant and halogen free. Additionally the PG-TSON-8 package supports the solder joint requirements for automated optical inspection (AOI).

As an interface between the physical bus layer and the HS CAN protocol controller, the TLE9250X protects the microcontroller against interferences generated inside the network. A very high ESD robustness and the perfect RF immunity allows the use in automotive application without adding additional protection devices, like suppressor diodes for example.

While the transceiver TLE9250X is not supplied the bus is switched off and illustrate an ideal passive behavior with the lowest possible load to all other subscribers of the HS CAN network.

Based on the high symmetry of the CANH and CANL output signals, the TLE9250X provides a very low level of electromagnetic emission (EME) within a wide frequency range. The TLE9250X fulfills even stringent EMC test limits without additional external circuit, like a common mode choke for example.

The perfect transmitter symmetry combined with the optimized delay symmetry of the receiver enables the TLE9250X to support CAN FD data frames. Depending on the size of the network and the along coming parasitic effects the device supports bit rates up to 5 MBit/s.

Fail-safe features like overtemperature protection, output current limitation or the TxD time-out feature protect the TLE9250X and the external circuitry from irreparable damage.

Table 1 Pin definitions and functions

Pin No.	Symbol	Function
1	TxD	Transmit Data Input; Internal pull-up to V _{IO} , “low” for “dominant” state.
2	GND	Ground
3	V _{CC}	Transmitter Supply Voltage; 100 nF decoupling capacitor to GND required.
4	RxD	Receive Data Output; “low” in “dominant” state.
5	V _{IO}	Digital Supply Voltage; Supply voltage input to adapt the logical input and output voltage levels of the transceiver to the microcontroller supply, 100 nF decoupling capacitor to GND required.
6	CANL	CAN Bus Low Level I/O; “low” in “dominant” state.
7	CANH	CAN Bus High Level I/O; “high” in “dominant” state.
8	RM	Receive-only Input; Internal pull-down to GND, “low” for Normal-operating mode.
PAD	–	Connect to PCB heat sink area. Do not connect to other potential than GND.

4 High-speed CAN functional description

HS CAN is a serial bus system that connects microcontrollers, sensors and actuators for real-time control applications. The use of the Controller Area Network (abbreviated CAN) within road vehicles is described by the international standard ISO 11898. According to the 7-layer OSI reference model the physical layer of a HS CAN bus system specifies the data transmission from one CAN node to all other available CAN nodes within the network. The physical layer specification of a CAN bus system includes all electrical specifications of a CAN network. The CAN transceiver is part of the physical layer specification. Several different physical layer standards of CAN networks have been developed in recent years.

4.1 High-speed CAN physical layer

Figure 3 High-speed CAN bus signals and logic signals

High-speed CAN functional description

The TLE9250X is a high-speed CAN transceiver, operating as an interface between the CAN controller and the physical bus medium. A HS CAN network is a two wire, differential network which allows data transmission rates up to 5 MBit/s. The characteristic for a HS CAN network are the two signal states on the CAN bus: “dominant” and “recessive” (see [Figure 3](#)).

The CANH and CANL pins are the interface to the CAN bus and both pins operate as an input and output. The RxD and TxD pins are the interface to the microcontroller. The pin TxD is the serial data input from the CAN controller, the RxD pin is the serial data output to the CAN controller. As shown in [Figure 1](#), the HS CAN transceiver TLE9250X includes a receiver and a transmitter unit, allowing the transceiver to send data to the bus medium and monitor the data from the bus medium at the same time. The HS CAN transceiver TLE9250X converts the serial data stream which is available on the transmit data input TxD, into a differential output signal on the CAN bus, provided by the CANH and CANL pins. The receiver stage of the TLE9250X monitors the data on the CAN bus and converts them to a serial, single-ended signal on the RxD output pin. A logical “low” signal on the TxD pin creates a “dominant” signal on the CAN bus, followed by a logical “low” signal on the RxD pin (see [Figure 3](#)). The feature, broadcasting data to the CAN bus and listening to the data traffic on the CAN bus simultaneously is essential to support the bit-to-bit arbitration within CAN networks.

The voltage levels for HS CAN transceivers are defined in ISO 11898-2. Whether a data bit is “dominant” or “recessive” depends on the voltage difference between the CANH and CANL pins:

$$V_{\text{Diff}} = V_{\text{CANH}} - V_{\text{CANL}}$$

To transmit a “dominant” signal to the CAN bus the amplitude of the differential signal V_{Diff} is higher than or equal to 1.5 V. To receive a “recessive” signal from the CAN bus the amplitude of the differential V_{Diff} is lower than or equal to 0.5 V.

“Partially-supplied” high-speed CAN networks are those where the CAN bus nodes of one common network have different power supply conditions. Some nodes are connected to the common power supply, while other nodes are disconnected from the power supply and in power-down state. Regardless of whether the CAN bus subscriber is supplied or not, each subscriber connected to the common bus media must not interfere with the communication. The TLE9250X is designed to support “partially-supplied” networks. In power-down state, the receiver input resistors are switched off and the transceiver input has a high resistance.

The voltage level on the digital input TxD and the digital output RxD is determined by the power supply level at the V_{IO} pin. Depending on the voltage level at the V_{IO} pin, the signal levels on the logic pins (STB, TxD and RxD) are compatible with microcontrollers having a 5 V or 3.3 V I/O supply. Usually the digital power supply V_{IO} of the transceiver is connected to the I/O power supply of the microcontroller (see [Figure 15](#)).

Modes of operation

5 Modes of operation

The TLE9250X supports three different modes of operation (see [Figure 4](#) and [Table 2](#)):

- Normal-operating mode
- Receive-only mode
- Forced-receive-only mode

Mode changes are either triggered by the mode selection input pin RM or by an undervoltage event on the transmitter supply V_{CC} . An undervoltage event on the digital supply V_{IO} powers down the TLE9250X.

Figure 4 Mode state diagram

Table 2 Modes of operation

Mode	RM	V_{IO}	V_{CC}	Bus Bias	Transmitter	Normal-mode Receiver
Normal-operating	"low"	"on"	"on"	$V_{CC}/2$	"on"	"on"
Receive-only	"high"	"on"	"on"	$V_{CC}/2$	"off"	"on"
Forced-receive-only	"X"	"on"	"X"	GND	"off"	"on"
Power-down state	"X"	"off"	"X"	floating	"off"	"off"

Modes of operation

5.1 Normal-operating mode

In Normal-operating mode the transceiver TLE9250X sends and receives data from the HS CAN bus. All functions are active (see also [Figure 4](#) and [Table 2](#)):

- The transmitter is active and drives the serial data stream on the TxD input pin to the bus pins CANH and CANL.
- The normal-mode receiver is active and converts the signals from the bus to a serial data stream on the RxD output.
- The RxD output pin indicates the data received by the normal-mode receiver.
- The bus biasing is connected to $V_{CC}/2$.
- The RM input pin is active and changes the mode of operation.
- The TxD time-out function is enabled and disconnects the transmitter in case a time-out is detected.
- The overtemperature protection is enabled and disconnects the transmitter in case an overtemperature is detected.
- The undervoltage detection on V_{CC} is enabled and triggers a mode change to Forced-receive-only in case an undervoltage event is detected.
- The undervoltage detection on V_{IO} is enabled and powers down the device in case of detection.

Normal-operating mode is entered from and Forced-receive-only mode, when the RM input pin is set to logical “low”.

Normal-operating mode can only be entered when all supplies are available:

- The transmitter supply V_{CC} is available ($V_{CC} > V_{CC(UV,R)}$).
- The digital supply V_{IO} is available ($V_{IO} > V_{IO(UV,R)}$).

5.2 Forced-receive-only mode

The Forced-receive-only mode is a fail-safe mode of the TLE9250X, which will be entered when the transmitter supply V_{CC} is not available. The following functions are available (see also [Figure 4](#) and [Table 2](#)):

- The transmitter is disabled and the data available on the TxD input is blocked.
- The normal-mode receiver is enabled.
- The RxD output pin indicates the data received by the normal-mode receiver.
- The bus biasing is connected to GND.
- A mode change by setting the RM input pin logical to “high” or “low” does not change the mode of operation.
- The TxD time-out function is disabled.
- The overtemperature protection is disabled.
- The undervoltage detection on V_{CC} is active.
- The undervoltage detection on V_{IO} is enabled and powers down the device in case of detection.
- Forced-receive-only mode is entered from power-down state if the input pin is set to logical “low” and the digital supply V_{IO} is available ($V_{IO} > V_{IO(UV,R)}$).
- Forced-receive-only mode is entered from Normal-operating mode by an undervoltage event on the transmitter supply V_{CC} .

5.3 Receive-only mode

In Receive-only mode the transmitter is disabled and the receiver is enabled. The TLE9250X can receive data from the bus, but cannot send any message (see also [Figure 4](#) and [Table 2](#)):

Modes of operation

- The transmitter is disabled and the data available on the TxD input is blocked.
- The normal-mode receiver is enabled.
- The RxD output pin indicates the data received by the normal-mode receiver.
- The bus biasing is connected to $V_{CC}/2$.
- The RM input pin is active and changes the mode of operation to Normal-operating mode, if logical “low”.
- The TxD time-out function is disabled.
- The overtemperature protection is disabled.
- The undervoltage detection on V_{CC} is active and changes the mode of operation to Forced-receive-only mode in case of detection.
- The undervoltage detection on V_{IO} is enabled and powers down the device in case of detection.
- Receive-only mode can only be entered when V_{CC} ($V_{CC} > V_{CC(UV,R)}$) and V_{IO} ($V_{IO} > V_{IO(UV,R)}$) are available.

5.4 Power-down state

Independent of the transmitter supply V_{CC} and of the status at RM input pin the TLE9250X is powered down if the supply voltage $V_{IO} < V_{IO(UV,F)}$ (see [Figure 4](#)).

In the power-down state the differential input resistors of the receiver are switched off. The CANH and CANL bus interface of the TLE9250X is floating and acts as a high-impedance input with a very small leakage current. The high-ohmic input does not influence the “recessive” level of the CAN network and allows an optimized EME performance of the entire HS CAN network. In power-down state the transceiver is an invisible node to the bus.

6 Changing the mode of operation

6.1 Power-up and power-down

The HS CAN transceiver TLE9250X powers up by applying the digital supply V_{IO} to the device ($V_{IO} > V_{IO(U,R)}$). After powering up, the device enters one out of three operating modes (see [Figure 5](#) and [Figure 6](#)).

Depending on the condition of the transmitter supply voltage V_{CC} and the mode selection pin RM the device can enter every mode of operation after the power-up:

- V_{CC} is available and the RM input is set to “low” - Normal-operating mode
- V_{CC} is disabled - Forced-receive-only mode
- V_{CC} is available and the RM input is set to “high” - Receive-only mode

The device TLE9250X powers down when the V_{IO} supply falls below the undervoltage detection threshold ($V_{IO} < V_{IO(U,F)}$), regardless if the transmitter supply V_{CC} is available or not. The power-down detection is active in every mode of operation.

Figure 5 Power-up and power-down

Figure 6 Power-up and power-down timings

Changing the mode of operation

6.2 Mode change by the RM pin

When the TLE9250X is supplied with the digital voltage V_{IO} the internal logic works and mode change by the mode selection pin RM is possible.

By default the RM input pin is logical “low” due to the internal pull-down current source to GND. Changing the RM input pin to logical “high” in Normal-operating mode triggers a mode change to Receive-only mode (see [Figure 7](#)). To enter Normal-operating mode or Receive-only mode the transmitter supply V_{CC} needs to be available.

Figure 7 Mode selection by the RM pin

Changing the mode of operation

6.3 Mode changes by V_{CC} undervoltage

When the transmitter supply V_{CC} ($V_{CC} < V_{CC(U/F)}$) is in undervoltage condition, the TLE9250X might not be able to provide the correct bus levels on the CANH and CANL output pins. To avoid any interference with the network the TLE9250X blocks the transmitter and changes the mode of operation when an undervoltage event is detected (see [Figure 8](#) and [Figure 9](#)).

In Normal-operating mode and in Receive-only mode a undervoltage event on supply V_{CC} ($V_{CC} < V_{CC(U/F)}$) triggers a mode change to Forced-receive-only mode.

In Forced-receive-only mode the undervoltage detection V_{CC} ($V_{CC} < V_{CC(U/F)}$) is enabled. In this mode the TLE9250X can operate without the transmitter supply V_{CC} .

Due to the internal pull-down current source at RM input pin the transceiver changes the mode of operation from Forced-receive-only mode to Normal-operating mode if V_{CC} is supplied again and no external signal is applied to the RM input pin.

Figure 8 Mode changes by undervoltage events on V_{CC}

Changing the mode of operation

Figure 9 Undervoltage on the transmitter supply V_{CC}

7 Fail safe functions

7.1 Short circuit protection

The CANH and CANL bus pins are proven to cope with a short circuit fault against GND and against the supply voltages. A current limiting circuit protects the transceiver against damages. If the device is heating up due to a continuous short on the CANH or CANL, the internal overtemperature protection switches off the bus transmitter.

7.2 Unconnected logic pins

The RM input pin has an internal pull-down current source to GND. All other logic input pins have an internal pull-up current source to V_{IO} . In case the V_{IO} and V_{CC} supply is activated and the logical pins are open, the TLE9250X enters into the Normal-operating mode by default.

7.3 TxD time-out function

The TxD time-out feature protects the CAN bus against permanent blocking in case the logical signal on the TxD pin is continuously “low”. A continuous “low” signal on the TxD pin might have its root cause in a locked-up microcontroller or in a short circuit on the printed circuit board, for example.

In Normal-operating mode, a logical “low” signal on the TxD pin for the time $t > t_{TxD}$ enables the TxD time-out feature and the TLE9250X disables the transmitter (see [Figure 10](#)). The receiver is still active and the data on the bus continues to be monitored by the RxD output pin.

Figure 10 TxD time-out function

Figure 10 illustrates how the transmitter is deactivated and activated again. A permanent “low” signal on the TxD input pin activates the TxD time-out function and deactivates the transmitter. To release the transmitter after a TxD time-out event, the TLE9250X requires a signal change on the TxD input pin from logical “low” to logical “high”.

Fail safe functions

7.4 Overtemperature protection

The TLE9250X has an integrated overtemperature detection to protect the TLE9250X against thermal overstress of the transmitter. The overtemperature protection is only active in Normal-operating mode. In case of an overtemperature condition, the temperature sensor will disable the transmitter while the transceiver remains in Normal-operating mode. After the device has cooled down the transmitter is activated again (see [Figure 11](#)). A hysteresis is implemented within the temperature sensor.

Figure 11 Overtemperature protection

8 General product characteristics

8.1 Absolute maximum ratings

Table 3 Absolute maximum ratings voltages, currents and temperatures¹⁾

All voltages with respect to ground; positive current flowing into pin;

ESD Resistivity							
ESD immunity at CANH, CANL versus GND	$V_{ESD_HBM_CAN}$	-8	–	8	kV	HBM (100 pF via 1.5 kΩ) ²⁾	P_8.1.11
ESD immunity at all other pins	$V_{ESD_HBM_ALL}$	-2	–	2	kV	HBM (100 pF via 1.5 kΩ) ²⁾	P_8.1.12
ESD immunity all pins	V_{ESD_CDM}	-750	–	750	V	CDM ³⁾	P_8.1.13

1) Not subject to production test, specified by design

2) ESD susceptibility, Human Body Model “HBM” according to ANSI/ESDA/JEDEC JS-001

3) ESD susceptibility, Charge Device Model “CDM” according to EIA/JESD22-C101 or ESDA STM5.3.1

Note: Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal-operating range. Protection functions are not designed for continuous repetitive operation.

General product characteristics

8.2 Functional range

Table 4 Functional range

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Supply Voltages							
Transmitter supply voltage	V _{CC}	4.5	–	5.5	V	–	P_8.2.1
Digital supply voltage	V _{IO}	3.0	–	5.5	V	–	P_8.2.2

4.5 V < V_{CC} < 5.5 V; 3.0 V < V_{IO} < 5.5 V; $R_L = 60 \Omega$; -40 °C < T_j < 150 °C; all voltages with respect to ground; positive current flowing into pin; unless otherwise specified.

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Delay Times							
Delay time for mode change	t_{Mode}	–	–	20	μs	1)	P_9.1.79
CAN FD characteristics							
Received recessive bit width at 2 MBit/s	$t_{\text{Bit(RxD)}}_{2\text{M}}$	400	500	550	ns	$C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$, $t_{\text{Bit}} = 500 \text{ ns}$, (see Figure 14);	P_9.1.84
Received recessive bit width at 5 MBit/s	$t_{\text{Bit(RxD)}}_{5\text{M}}$	120	200	220	ns	$C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$, $t_{\text{Bit}} = 200 \text{ ns}$, (see Figure 14);	P_9.1.85
Transmitted recessive bit width at 2 MBit/s	$t_{\text{Bit(Bus)}}_{2\text{M}}$	435	500	530	ns	$C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$, $t_{\text{Bit}} = 500 \text{ ns}$, (see Figure 14);	P_9.1.86
Transmitted recessive bit width at 5 MBit/s	$t_{\text{Bit(Bus)}}_{5\text{M}}$	155	200	210	ns	$C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$, $t_{\text{Bit}} = 200 \text{ ns}$, (see Figure 14);	P_9.1.87
Receiver timing symmetry at 2 MBit/s $\Delta t_{\text{Rec}_2\text{M}} = t_{\text{Bit(RxD)}}_{2\text{M}} - t_{\text{Bit(Bus)}}_{2\text{M}}$	$\Delta t_{\text{Rec}_2\text{M}}$	-65	–	40	ns	$C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$, $t_{\text{Bit}} = 500 \text{ ns}$, (see Figure 14);	P_9.1.88
Receiver timing symmetry at 5 MBit/s $\Delta t_{\text{Rec}_5\text{M}} = t_{\text{Bit(RxD)}}_{5\text{M}} - t_{\text{Bit(Bus)}}_{5\text{M}}$	$\Delta t_{\text{Rec}_5\text{M}}$	-45	–	15	ns	$C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$, $t_{\text{Bit}} = 200 \text{ ns}$, (see Figure 14);	P_9.1.89

1) Not subject to production test, specified by design.

2) VSYM shall be observed during dominant and recessive state and also during the transition from dominant to recessive and vice versa, while TxD is stimulated by a square wave signal with a frequency of 1 MHz.

Application information

10 Application information

10.1 ESD robustness according to IEC61000-4-2

Tests for ESD robustness according to IEC61000-4-2 “Gun test” (150 pF, 330 Ω) have been performed. The results and test conditions are available in a separate test report.

Table 7 ESD robustness according to IEC61000-4-2

Performed Test	Result	Unit	Remarks
Electrostatic discharge voltage at pin CANH and CANL versus GND	$\geq +11$	kV	¹⁾ Positive pulse
Electrostatic discharge voltage at pin CANH and CANL versus GND	≤ -11	kV	¹⁾ Negative pulse

1) Not subject to production test. ESD susceptibility “ESD GUN” according to GIFT / ICT paper: “EMC Evaluation of CAN Transceivers, version IEC TS62228”, section 4.3. (DIN EN61000-4-2)
Tested by external test facility (IBEE Zwickau, EMC test report Nr. 01-07-2017 and Nr. 06-08-17)

10.2 Application example

Figure 15 Application circuit

Application information

10.3 Voltage adaption to the microcontroller supply

To adapt the digital input and output levels of the TLE9250X to the I/O levels of the microcontroller, connect the power supply pin V_{IO} to the microcontroller voltage supply (see [Figure 15](#)).

Note: In case no dedicated digital supply voltage V_{IO} is required in the application, connect the digital supply voltage V_{IO} to the transmitter supply V_{CC} .

10.4 Further application information

Figure 17 PG-DSO-8 (Plastic Dual Small Outline)

Green product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS compliant (i.e. Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

For further information on alternative packages, please visit our website:
<http://www.infineon.com/packages>.

Revision history

12 Revision history

Revision	Date	Changes
1.1	2018-05-23	Data Sheet updated: • I_{CC_D} max. lowered from 60mA to 48mA (see P_9.1.2) • $t_{Delay(UV)}$ divided in $t_{Delay(UV)_F}$ (max. 30μs) and $t_{Delay(UV)_R}$ (max. 100μs)(see P_9.1.18 and Figure 9) • Removed description of bus wake-up capability in Chapter 4 • Updated Figure 13. Removed unspecified parameters $t_{d(L),T}$, $t_{d(L),R}$, $t_{d(H),T}$, $t_{d(H),R}$. • Editorial Changes
1.0	2017-09-14	Data Sheet created

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
