Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (\_), the underscore (\_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (\_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at [www.onsemi.com](http://www.onsemi.com). Please email any questions regarding the system integration to [Fairchild\\_questions@onsemi.com](mailto:Fairchild_questions@onsemi.com).

## Absolute Maximum Ratings (No derating required up to 70°C)

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Characteristics	Test Conditions	Min.	Typ.	Max.	Unit
$V_{ISO}$	Withstand Insulation Voltage	Relative humidity < 50%, $T_A = 25^\circ\text{C}$ , $t = 1\text{ min}$ , $I_{I-O} \leq 2\mu\text{A}^{(9)(10)}$	2500			$V_{RMS}$

#### Notes:

- $T_{PHL}$  propagation delay is measured from the 2.5V level of the leading edge of a 5.0V input pulse (1 $\mu\text{s}$  rise time) to the 1.5 V level on the leading edge of the output pulse.  $T_{PLH}$  propagation delay is measured on the trailing edges of the input and output pulse. (Refer to Fig. 9)
- Common mode transient immunity in logic high level is the maximum tolerable (positive)  $dV_{cm}/dt$  on the leading edge of the common mode pulse signal  $V_{CM}$ , to assure that the output will remain in a logic high state (i.e.,  $V_O > 2.0\text{ V}$ ). Common mode transient immunity in logic low level is the maximum tolerable (negative)  $dV_{cm}/dt$  on the trailing edge of the common mode pulse signal,  $V_{CM}$ , to assure that the output will remain in a logic low state (i.e.,  $V_O < 0.8\text{ V}$ ). Refer to Fig. 10.
- In applications where  $dV_{cm}/dt$  may exceed 50,000  $\text{V}/\mu\text{s}$  (Such as static discharge), a series resistor,  $R_{CC}$ , should be included to protect the detector chip from destructive surge currents. The recommended value for  $R_{CC}$  is 240V per volt of allowable drop in  $V_{CC}$  (between pin 8 and  $V_{CC}$ ) with a minimum value of 240 $\Omega$ .
- Device is considered a two terminal device: Pins 1, 2, 3 and 4 are shorted together and Pins 5, 6, 7 and 8 are shorted together.
- The 2500  $V_{RMS}/1\text{ min.}$  capability is validated by a 3.0  $\text{kV}_{RMS}/1\text{ sec.}$  dielectric voltage withstand test.
- AC voltage is instantaneous voltage for  $V_{TH+}$  &  $V_{TH-}$ .
- All typicals at  $T_A = 25^\circ\text{C}$ ,  $V_{CC} = 5\text{V}$  unless otherwise specified.
