

CC1050 Single Chip Very Low Power RF Transmitter

Applications

- Very low power UHF wireless data transmitters
- 315 / 433 / 868 and 915 MHz ISM/SRD band systems
- **Product Description**

CC1050 is a true single-chip UHF transmitter designed for very low power and very low voltage wireless applications. The circuit is mainly intended for the ISM (Industrial, Scientific and Medical) and SRD (Short Range Device) frequency bands at 315, 433, 868 and 915 MHz, but can easily be programmed for operation at other frequencies in the 300-1000 MHz range.

The main operating parameters of **CC1050** can be programmed via an easy-tointerface serial bus, thus making **CC1050** a very flexible and easy to use transmitter. In a typical system **CC1050** will be used together with a microcontroller and a few external passive components.

Features

- True single chip UHF RF transmitter
- Very low current consumption
- Frequency range 300 1000 MHz
- Programmable output power -20 to 12 dBm
- Small size (TSSOP-24 package)
- Low supply voltage (2.1 V to 3.6 V)
- Very few external components required
- Single-ended antenna connection
- FSK data rate up to 76.8 kBaud

- RKE Remote Keyless Entry
- Home automation
- Wireless alarm and security systems
- AMR Automatic Meter Reading
- Low power telemetry
- Game Controllers and advanced toys

CC1050 is based on Chipcon's SmartRF[®] technology in 0.35 μ m CMOS.

- Complies with EN 300 220 and FCC CFR47 part 15
- Programmable frequency in 250 Hz steps makes crystal temperature drift compensation possible without TCXO
- Suitable for frequency hopping protocols
- Development Kit available
- Easy-to-use software for generating the *CC1050* configuration data

Absolute Maximum Ratings

Parameter	Min.	Max.	Units	Condition
Supply voltage, VDD	-0.3	5.0	V	
Voltage on any pin	-0.3	VDD+0.3,	V	
		max 5.0		
Input RF level		10	dBm	
Storage temperature range	-50	150	°C	
Reflow soldering temperature		260	°C	T = 10 s

Under no circumstances the absolute maximum ratings given above should be violated. Stress exceeding one or more of

the limiting values may cause permanent damage to the device.

Caution! ESD sensitive device. Precaution should be used when handling the device in order to prevent permanent damage.

Operating Conditions

Parameter	Min.	Тур.	Max.	Unit	Condition / Note
RF Frequency Range	300		1000	MHz	Programmable in steps of 250 Hz
Operating ambient temperature range	-40		85	°C	
Supply voltage	2.1	3.0	3.6	V	Note: The same supply voltage should be used for digital (DVDD) and analogue (AVDD) power.

Electrical Specifications

Tc = 25° C, VDD = 3.0 V if nothing else stated

Parameter	Min.	Тур.	Max.	Unit	Condition / Note
Transmit Section					
Transmit data rate	0.6		76.8	kBaud	NRZ or Manchester encoding. 76.8 kBaud equals 76.8 kbit/s using NRZ coding. See page 15.
Binary FSK frequency separation	0		65	kHz	The frequency separation is programmable in 250 Hz steps. 65 kHz is the maximum guaranteed separation at 1 MHz reference frequency. Larger separations can be achieved at higher reference frequencies.
Output power 433 MHz 868 MHz	-20 -20		12 8	dBm dBm	Delivered to 50 Ω load. The output power is programmable.
RF output impedance 433/868 MHz		110 / 70		Ω	Transmit mode. For matching details see p.24.

Parameter	Min.	Тур.	Max.	Unit	Condition / Note
Spurious emission			-36	dBm	Complies with EN 300 220
Harmonics		-20		dBc	An external LC should be used to reduce harmonics emission to comply with SRD requirements. See p.27.
Frequency Synthesiser Section					
Crystal Oscillator Frequency	3		16	MHz	Crystal frequency can be 3-4, 6-8 or 9-16 MHz. Recommended frequencies are 3.6864, 7.3728, 11.0592 and 14.7456. See page 26 for details.
Crystal frequency accuracy requirement		± 50 ± 25		ppm	433 MHz 868 MHz The crystal frequency accuracy and drift (ageing and temperature dependency) will determine the frequency accuracy of the transmitted signal.

Pin Assignment

Pin no.	Pin name	Pin type	Description
1	AVDD	Power (A)	Power supply (3 V) for analog modules (PA)
2	AGND	Ground (A)	Ground connection (0 V) for analog modules (PA)
3	AGND	Ground (A)	Ground connection (0 V) for analog modules (PA)
4	AGND	Ground (A)	Ground connection (0 V) for analog modules (VCO and prescaler)
5	L1	Analog input	Connection no 1 for external VCO tank inductor
6	L2	Analog input	Connection no 2 for external VCO tank inductor
7	AVDD	Power (A)	Power supply (3 V) for analog modules (VCO and prescaler)
8	CHP_OUT	Analog output	Charge pump current output when external loop filter is used The pin can also be used as PLL Lock indicator. Output is high when PLL is in lock.
9	R_BIAS	Analog output	Connection for external precision bias resistor (82 k Ω , ± 1%)
10	AGND	Ground (A)	Ground connection (0 V) for analog modules (backplane)
11	AVDD	Power (A)	Power supply (3 V) for analog modules (general)
12	AGND	Ground (A)	Ground connection (0 V) for analog modules (general)
13	XOSC_Q2	Analog output	Crystal, pin 2
14	XOSC_Q1	Analog input	Crystal, pin 1, or external clock input
15	AGND	Ground (A)	Ground connection (0 V) for analog modules (guard)
16	DGND	Ground (D)	Ground connection (0 V) for digital modules (substrate)
17	DVDD	Power (D)	Power supply (3 V) for digital modules
18	DGND	Ground (D)	Ground connection (0 V) for digital modules
19	DI	Digital input	Data input in transmit mode
20	DCLK	Digital output	Clock for data in transmit mode
21	PCLK	Digital input	Programming clock for 3-wire bus
22	PDATA	Digital	Programming data for 3-wire bus. Programming data input for
		input/output	write operation, programming data output for read operation
23	PALE	Digital input	Programming address latch enable for 3-wire bus
24	RF_OUT	RF output	RF signal output to antenna

A=Analog, D=Digital

(Top View)

Circuit Description

Figure 1. Simplified block diagram

A simplified block diagram of **CC1050** is shown in Figure 1. Only signal pins are shown.

The voltage controlled oscillator (VCO) output signal is fed directly to the power amplifier (PA). The RF output is frequency shift keyed (FSK) by the digital bit stream fed to the pin DI. The single ended PA makes the antenna interface and matching very easy.

The frequency synthesiser generates the local oscillator signal which is fed to the PA in transmit mode. The frequency synthesiser consists of a crystal oscillator (OSC), phase detector (PD), charge pump (CHARGE PUMP), VCO, and frequency dividers (/R and /N). An external crystal must be connected to XOSC, and only an external inductor is required for the VCO.

The 3-wire digital serial interface (CONTROL) is used for configuration.

Application Circuit

Very few external components are required for the operation of *CC1050*. A typical application circuit is shown Figure 2. Component values are shown in Table 1.

Output matching

C1, C2 and L2 are used to match the transmitter to 50 Ω . See Output Matching p.24 for details.

VCO inductor

The VCO is completely integrated except for the inductor L1. For further details see p. 17.

Component values for the matching network and VCO inductor are easily calculated using the SmartRF® Studio software.

Crystal oscillator

C3 and C4 are the loading capacitors for the crystal. See page 26 for details.

Additional filtering

Additional filtering (e.g. a low pass LCfilter) may be used in order to reduce the harmonic emission. See also Optional LC Filter p.27 for further information.

Power supply decoupling and filtering

Power supply decoupling and filtering must be used (not shown in the application circuit). The placement and size of the decoupling capacitors and the power supply filtering are very important to achieve the optimum performance. Chipcon provides a reference design (CC1050EB) that should be followed very closely.

Figure 2. Typical *CC1050* application circuit

Item	315 MHz	433 MHz	868 MHz	915 MHz

Notes:

Items shaded are different for different frequencies.

Component values for 868 and 915 MHz are equal.

*) C3 and C4 will depend on the crystal load capacitance, see page 26.

Table 1. Bill of materials for the application circuit

Configuration Overview

CC1050 can be configured to achieve the best performance for different applications. Through the programmable configuration registers the following key parameters can be programmed:

- Transmit mode / power-down / powerup mode
- RF output power
- Frequency synthesiser key parameters: RF output frequency, FSK

frequency separation (deviation), crystal oscillator reference frequency

- Crystal oscillator power-up / power down
- Data rate and data format (NRZ, Manchester coded or UART interface)
- Synthesiser lock indicator mode
- Modulation spectrum shaping

Configuration Software

Chipcon provides users of **CC1050** with a software program, SmartRF® Studio (Windows interface) that generates all necessary **CC1050** configuration data based on the user's selections of various parameters. These hexadecimal numbers will then be the necessary input to the microcontroller for the configuration of

CC1050. In addition the program will provide the user with the component values needed for the output matching circuit and the VCO inductor.

Figure 3 shows the user interface of the *CC1050* configuration software.

Figure 3. SmartRF® Studio user interface

3-wire Serial Configuration Interface

CC1050 is configured via a simple 3-wire interface (PDATA, PCLK and PALE). There are 19 8-bit configuration registers, each addressed by a 7-bit address. A Read/Write bit initiates a read or write operation. A full configuration of *CC1050* requires sending 19 data frames of 16 bits each (7 address bits, R/W bit and 8 data The time needed for a full bits). configuration depend on the PCLK frequency. With a PCLK frequency of 10 MHz the full configuration is done in less than 30 µs. Setting the device in power down mode requires sending one frame only and will in this case take less than 2 us. All registers are also readable.

In each write-cycle 16 bits are sent on the PDATA-line. The seven most significant bits of each data frame (A6:0) are the address-bits. A6 is the MSB (Most Significant Bit) of the address and is sent as the first bit. The next bit is the R/W bit (high for write, low for read). During address and R/W bit transfer the PALE (Program Address Latch Enable) must be kept low. The 8 data-bits are then transferred (D7:0). See Figure 4.

The timing for the programming is also shown in Figure 4 with reference to Table 2. The clocking of the data on PDATA is done on the negative edge of PCLK. When the last bit, *D0*, of the 8 data-bits has been loaded, the data word is loaded in the internal configuration register.

The configuration data is stored in internal RAM and is valid after power-down mode, but not when the power-supply is turned off. The registers can be programmed in any order.

The configuration registers can also be read by the microcontroller via the same configuration interface. The seven address bits are sent first, then the R/W bit set <u>low</u> to initiate the data read-back. **CC1050** then returns the data from the addressed register. PDATA is in this case used as an output and must be tri-stated (or set high n the case of an open collector pin) by the microcontroller during the data read-back (D7:0). The read operation is illustrated in Figure 5.

Figure 4. Configuration registers write operation

Figure 5. Configuration registers read operation

Parameter	Symbol	Min	Мах	Units	Conditions
PCLK, clock frequency	F _{сLоск}	-	10	MHz	
PCLK low pulse duration	$T_{CL,min}$	50		ns	The minimum time PCLK must be low.
PCLK high pulse duration	T _{CH,min}	50		ns	The minimum time PCLK must be high.
PALE setup time	T _{SA}	10	-	ns	The minimum time PALE must be low before negative edge of PCLK.
PALE hold time	T _{HA}	10	-	ns	The minimum time PALE must be held low after the <i>positive</i> edge of PCLK.
PDATA setup time	T _{SD}	10	-	ns	The minimum time data on PDATA must be ready before the negative edge of PCLK.
PDATA hold time	T _{HD}	10	-	ns	The minimum time data must be held at PDATA, after the negative edge of PCLK.
Rise time	T _{rise}		100	ns	The maximum rise time for PCLK and PALE
Fall time	T_{fall}		100	ns	The maximum fall time for PCLK and PALE

Note: The set-up- and hold-times refer to 50% of VDD.

Table 2. Serial interface, timing specification

Microcontroller Interface

Used in a typical system, *CC1050* will interface to a microcontroller. This microcontroller must be able to:

- Program *CC1050* into different modes via the 3-wire serial configuration interface (PDATA, PCLK and PALE).
- Interface to the synchronous data signal interface (DI and DCLK).

Connecting the microcontroller

The microcontroller uses 3 output pins for the configuration interface (PDATA, PCLK and PALE). PDATA should be a bidirectional pin for data read-back. The DI pin is used for data to be transmitted. DCLK providing the data timing should be connected to a microcontroller input. Optionally another pin can be used to monitor the LOCK signal (available at the CHP_OUT pin). This signal is logic level high when the PLL is in lock. See Figure **6**.

- Optionally the microcontroller can do data encoding / decoding.
- Optionally the microcontroller can monitor the frequency lock status from pin CHP_OUT (LOCK).

The microcontroller pins connected to PDATA and PCLK can be used for other purposes when the configuration interface is not used. PDATA and PCLK are high impedance inputs as long as PALE high.

PALE has an internal pull-up resistor and should be left open (tri-stated by the microcontroller) or set to a high level during power down mode in order to prevent a trickle current flowing in the pullup.

Figure 6. Microcontroller interface

Signal interface

The signal interface consists of DI and DCLK and is used for the data to be transmitted. DI is the data input line and DCLK provides a synchronous clock during data transmission.

The **CC1050** can be used with NRZ (Non-Return-to-Zero) data or Manchester (also known as bi-phase-level) encoded data.

CC1050 can be configured for three different data formats:

<u>Synchronous NRZ mode</u>. **CC1050** provides the data clock at DCLK, and DI is used as data input. Data is clocked into **CC1050** at the rising edge of DCLK. The data is modulated at RF without encoding. **CC1050** can be configured for the data rates 0.6, 1.2, 2.4, 4.8, 9.6, 19.2, 38.4 or 76.8 kbit/s. See Figure 7.

Synchronous Manchester encoded mode. **CC1050** provides the data clock at DCLK, and DI is used as data input. Data is clocked into **CC1050** at the rising edge of DCLK and should be in NRZ format. The data is modulated at RF with Manchester code. The encoding is done by **CC1050**. In this mode **CC1050** can be configured for the data rates 0.3, 0.6, 1.2, 2.4, 4.8, 9.6, 19.2 or 38.4 kbit/s. The 38.4 kbit/s rate corresponds to the maximum 76.8 kBaud due to the Manchester encoding. See Figure 8.

<u>Transparent Asynchronous UART mode</u>. In transmit mode DI is used as data input. The data is modulated at RF without synchronisation or encoding. Data rates in the range from 0.6 to 76.8 kBaud can be used. See Figure 9.

Manchester encoding

In the Synchronous Manchester encoded mode **CC1050** uses Manchester coding when modulating the data. The Manchester code is based on transitions; a "0" is encoded as a low-to-high transition, a "1" is encoded as a high-tolow transition. See Figure 10.

The Manchester code ensures that the signal has a constant DC component, which is necessary in some FSK demodulators. Using this mode also ensures compatibility with CC400/CC900 designs.

Figure 7. Synchronous NRZ mode

Figure 8. Synchronous Manchester encoded mode

Figure 10. Manchester encoding

Frequency programming

The operation frequency is set by programming the frequency word in the configuration registers. There are two frequency words registers, termed *A* and *B*, which can be programmed to two different frequencies in order to switch fast between two different channels. Frequency word *A* or *B* is selected by the F_REG bit in the *MAIN* register.

The frequency word is 24 bits (3 bytes) located in *FREQ_2A:FREQ_1A:FREQ_0A* and *FREQ_2B:FREQ_1B:FREQ_0B* for the *A* and *B* word respectively.

The FSK frequency separation is programmed in the *FSEP1:FSEP0* registers (11 bits).

The frequency word *FREQ* is calculated by:

VCO

Only one external inductor (L1) is required for the VCO. The inductor will determine the operating frequency range of the circuit. It is important to place the inductor as close to the pins as possible in order to reduce stray inductance. It is recommended to use a high Q, low tolerance inductor for best performance.

VCO and PLL self-calibration

To compensate for supply voltage, temperature and process variations the VCO and PLL must be calibrated. The calibration is done automatically and sets maximum VCO tuning range and optimum charge pump current for PLL stability. After setting up the device at the operating frequency, the self-calibration can be initiated by setting the *CAL_START* bit. The calibration result is stored internally in the chip, and is valid as long as power is not turned off. If large supply voltage variations (more than 0.5 V) or temperature variations (more than 40 degrees) occur after calibration, a new calibration should be performed.

$$f_{vco} = f_{ref} \cdot \frac{FREQ + 8192}{16384}$$

where the reference frequency is the crystal oscillator clock divided by *REFDIV* (4 bits in the *PLL* register), a number between 2 and 15:

$$f_{ref} = \frac{f_{xosc}}{REFDIV}$$

The equation above gives the VCO frequency, that is, f_{VCO} is the f_0 frequency for transmit mode (lower FSK frequency).

The upper FSK frequency is given by: $f_1 = f_0 + f_{sep}$ where f_{sep} is set by the separation word:

$$f_{sep} = f_{ref} \cdot \frac{FSEP}{16384}$$

Typical tuning range for the integrated varactor is 20-25%.

Component values for various frequencies are given in Table 1. Component values for other frequencies can be found using the SmartRF® Studio software.

The self-calibration is controlled through the *CAL* register (see configuration registers description p. 30). The *CAL_COMPLETE* bit indicates complete calibration. The user can poll this bit, or simply wait for 26 ms (calibration wait time when *CAL_WAIT* = 1). The wait time is proportional to the internal PLL reference frequency. The lowest permitted reference frequency (1 MHz) gives 26 ms wait time, which is therefore the worst case.

Reference frequency [MHz]	Calibration time [ms]
2.4	11
2.0	13
1.5	18
1.0	26

The *CAL_COMPLETE* bit can also be monitored at the CHP_OUT (LOCK) pin (configured by *LOCK_SELECT[3:0]*) and used as an interrupt input to the microcontroller.

The CAL_START bit must be set to 0 by the microcontroller after the calibration is done.

There are separate calibration values for the two frequency registers. If the two frequencies, A and B, differ more than 1 MHz, or different VCO currents are used (*VCO_CURRENT[3:0]* in the *CURRENT* register) the calibration should be done separately. The *CAL_DUAL* bit in the *CAL* register controls dual or separate calibration.

The single calibration algorithm using separate calibration for two frequencies is illustrated in Figure 11.

In Figure 12 the dual calibration algorithm is shown.

Chipcon Products from Texas Instruments

CC1050

Figure 11. Single calibration algorithm for two different frequencies

CC1050

Figure 12. Dual calibration algorithm

FF1050

VCO current control

The VCO current is programmable and should be set according to operating frequency and output power. Recommended settings for the VCO_CURRENT bits in the CURRENT register are shown in the tables on page 32. The bias current for the PA buffers are also programmable. Recommended settings for the *PA_DRIVE* bits in the *CURRENT* register are shown in the tables on page 32.

Power management

CC1050 offers great flexibility for power management in order to meet strict power consumption requirements in battery operated applications. Power Down mode is controlled through the *MAIN* register. There are separate bits to control the TX part, the frequency synthesiser and the crystal oscillator. This individual control can be used to optimise for lowest possible current consumption in a certain application. A typical power-on and initialising sequence for minimum power consumption is shown in Figure 13 and Figure 14.

PALE should be tri-stated or set to a high level during power down mode in order to prevent a trickle current from flowing in the internal pull-up resistor.

PA_POW should be set to 00h during power down mode to ensure lowest possible leakage current.

CC1050

Figure 13. Initializing sequence

CC1050

Figure 14. Sequence for activating TX mode

Output Matching

A few passive external components ensures match in TX mode. The matching network is shown in Figure 15. Component values for various frequencies are given in Table 1. Component values for other frequencies can be found using the configuration software.

Output power programming

The RF output power is programmable and controlled by the PA_POW register.

Table 3 shows the closest programmable value for output powers in steps of 1 dB. The typical current consumption is also shown.

In power down mode the PA_POW should be set to 00h for minimum leakage current.

Output power	RF frequency 433	B MHz	RF frequency 8	68 MHz

Table 3. Output power settings and typical current consumption

Crystal oscillator

CC1050 has an advanced amplitude regulated crystal oscillator. A high current is used to start up the oscillations. When the amplitude builds up, the current is reduced to what is necessary to maintain a 600 mVpp amplitude. This ensures a fast start-up, keeps the current consumption as well as the drive level to a minimum and makes the oscillator insensitive to ESR variations.

An external clock signal or the internal crystal oscillator can be used as main frequency reference. An external clock signal should be connected to XOSC_Q1, while XOSC_Q2 should be left open. The *XOSC_BYPASS* bit in the *XOSC* register should be set when an external clock signal is used.

The crystal frequency should be in the range 3-4, 6-8 or 9-16 MHz. Because the crystal frequency is used as reference for the data rate (as well as other internal functions), the following frequencies are recommended: 3.6864, 7.3728, 11.0592 or 14.7456 MHz. These frequencies will give accurate data rates. The crystal frequency range is selected by *XOSC_FREQ1:0* in the *MODEM0* register.

To operate in synchronous mode at data rates different from the standards at 1.2, 2.4, 4.8 kBaud and so on, the crystal frequency can be scaled. The data rate (DR) will change proportionally to the new crystal frequency (f). To calculate the new crystal frequency:

$$f_{xtal_new} = f_{xtal} \frac{DR_{new}}{DR}$$

Using the internal crystal oscillator, the crystal must be connected between XOSC_Q1 and XOSC_Q2. The oscillator is designed for parallel mode operation of the crystal. In addition loading capacitors (C3 and C4) for the crystal are required. The loading capacitor values depend on the total load capacitance, C_L , specified for the crystal. The total load capacitance seen between the crystal terminals should equal C_L for the crystal to oscillate at the specified frequency.

$$C_L = \frac{1}{\frac{1}{C_3} + \frac{1}{C_4}} + C_{parasitic}$$

The parasitic capacitance is constituted by pin input capacitance and PCB stray capacitance. Typically the total parasitic capacitance is 8 pF. A trimming capacitor may be placed across C4 for initial tuning if necessary.

The crystal oscillator circuit is shown in Figure 16. Typical component values for different values of C_L are given in Table 4.

The initial tolerance, temperature drift, ageing and load pulling should be carefully specified in order to meet the required frequency accuracy in a certain application.

Figure 16. Crystal oscillator circuit

Item	C _L = 12 pF	C _L = 16 pF	С _L = 22 рF
C3	6.8 pF	15 pF	27 pF
C4	6.8 pF	15 pF	27 pF

Optional LC Filter

An optional LC filter may be added between the antenna and the matching network in certain applications. The filter will reduce the emission of harmonics.

A Pi-type filter topology is shown in Figure 17. Component values are given in Table 5. The filter is designed for 50 Ω terminations. The component values may have to be tuned to compensate for layout parasitics.

A T-Type LC filter can be used to further attenuate harmonics if the Pi-type filter is not sufficient. A T-type filter provides much better stop-band attenuation than a Pitype filter due to improved insulation between input and output. For more details refer to Application Note *AN028 LC Filter with Improved High-Frequency Attenuation* available from the Chipcon web site.

Figure 17. LC filter

Item	315 MHz	433 MHz	868 MHz	915 MHz
C71	30 pF	20 pF	10 pF	10 pF
C72	30 pF	20 pF	10 pF	10 pF

System Considerations and Guidelines

SRD regulations

International regulations and national laws regulate the use of radio receivers and transmitters. SRDs (Short Range Devices) for licence free operation are allowed to operate in the 433 and 868-870 MHz bands in most European countries. In the United States such devices operate in the 260–470 and 902-928 MHz bands. *CC1050* is designed to meet the requirements for operation in all these bands. A summary of the most important aspects of these regulations can be found in Application Note *AN001 SRD regulations for licence free transceiver operation*, available from Chipcon's web site.

Low cost systems

In systems where low cost is of great importance the *CC1050* is the ideal choice. Very few external components keep the total cost at a minimum. The oscillator crystal can then be a low cost crystal with 50 ppm frequency tolerance.

Battery operated systems

In low power applications the power down mode should be used when not being active. Depending on the start-up time requirement, the oscillator core can be powered during power down. See page 21 for information on how effective power management can be implemented.

Crystal drift compensation

A unique feature in **CC1050** is the very fine frequency resolution of 250 Hz. This can be used to do the temperature

compensation of the crystal if the temperature drift curve is known and a temperature sensor is included in the system. Even initial adjustment can be done using the frequency programmability. This eliminates the need for an expensive TCXO and trimming in some applications. In less demanding applications a crystal with low temperature drift and low ageing could be used without further compensation. A trimmer capacitor in the crystal oscillator circuit (in parallel with C4) could be used to set the initial frequency accurately.

High output power systems

The CHP_OUT (LOCK) pin can be configured to control an power amplifier. This is controlled by *LOCK_SELECT* in the *LOCK* register.

Frequency hopping spread spectrum systems

Due to the very fast frequency shift properties of the PLL, the **CC1050** is also suitable for frequency hopping systems. Hop rates of 1-100 hops/s are usually used depending on the bit rate and the amount of data to be sent during each transmission. The two frequency registers (*FREQ_A* and *FREQ_B*) are designed such that the 'next' frequency can be programmed while the 'present' frequency is used. The switching between the two frequencies is done through the *MAIN* register.

PCB Layout Recommendations

A two layer PCB is highly recommended. The bottom layer of the PCB should be the "ground-layer". Chipcon provide reference designs that should be followed in order to achieve the best performance.

The top layer should be used for signal routing, and the open areas should be filled with metallisation connected to ground using several vias.

The ground pins should be connected to ground as close as possible to the package pin using individual vias. The decoupling capacitors should also be placed as close as possible to the supply pins and connected to the ground plane by separate vias.

The external components should be as small as possible and surface mount devices should be used.

Antenna Considerations

CC1050 can be used together with various types of antennas. The most common antennas for short range communication are monopole, helical and loop antennas.

Monopole antennas are resonant antennas with a length corresponding to one quarter of the electrical wavelength $(\lambda/4)$. They are very easy to design and can be implemented simply as a "piece of wire" or even integrated into the PCB.

Non-resonant monopole antennas shorter than $\lambda/4$ can also be used, but at the expense of range. In size and cost critical applications such an antenna may very well be integrated into the PCB.

Helical antennas can be thought of as a combination of a monopole and a loop antenna. They are a good compromise in size critical applications. But helical antennas tend to be more difficult to optimise than the simple monopole.

Loop antennas are easy to integrate into the PCB, but are less effective due to Precaution should be used when placing the microcontroller in order to avoid interference with the RF circuitry.

In certain applications where the ground plane for the digital circuitry is expected to be noisy, the ground plane may be split in an analogue and a digital part. All AGND pins and AVDD de-coupling capacitors should be connected to the analogue ground plane. All DGND pins and DVDD de-coupling capacitors should be connected to the digital ground. The connection between the two ground planes should be implemented as a star connection with the power supply ground.

A development kit with a fully assembled PCB is available, and can be used as a guideline for layout.

difficult impedance matching because of their very low radiation resistance.

For low power applications the $\lambda/4$ monopole antenna is recommended giving the best range and because of its simplicity.

The length of the $\lambda/4$ -monopole antenna is given by:

L = 7125 / f

where f is in MHz, giving the length in cm. An antenna for 869 MHz should be 8.2 cm, and 16.4 cm for 434 MHz.

The antenna should be connected as close as possible to the IC. If the antenna is located away from the input pin the antenna should be matched to the feeding transmission line (50 Ω).

For a more thorough primer on antennas, please refer to Application *Note AN003 SRD Antennas* available from Chipcon's web site.

Configuration registers

The configuration of *CC1050* is done by programming the 19 8-bit configuration registers. The configuration data based on selected system parameters are most easily found by using the SmartRF®

Studio software. A complete description of the registers are given in the following tables. After a RESET is programmed all the registers have default values.

REGISTER OVERVIEW

MAIN Register (00h)

REGISTER	NAME	Default	Active	Description
		value		
MAIN[7]	-	-	-	Not used
MAIN[6]	F_REG	-	-	Selection of Frequency Register, 0 : Register A, 1 :
				Register B
MAIN[5]	-	-	-	Not used
MAIN[4]	TX_PD	-	Н	Power Down of Signal Interface and PA
MAIN[3]	FS_PD	-	Н	Power Down of Frequency Synthesiser
MAIN[2]	CORE_PD	-	Н	Power Down of Crystal Oscillator Core
MAIN[1]	BIAS_PD	-	Н	Power Down of BIAS (Global_Current_Generator)
				and Crystal Oscillator Buffer
MAIN[0]	RESET_N	-	L	Reset, active low. Writing RESET_N low will write default
				values to all other registers than MAIN. Bits in MAIN do
				not have a default value, and will be written directly
				through the configurations interface. Must be set high to
				complete reset.

FREQ_2A Register (01h)

REGISTER	NAME	Default	Active	Description
		value		
FREQ_2A[7:0]	FREQ_A[23:16]	01110101	-	8 MSB of frequency control word A

FREQ_1B Register (05h)

REGISTER	NAME	Default value	Active	Description
FREQ_1B[7:0]	FREQ_B[15:8]	10100101	-	Bit 15 to 8 of frequency control word B

FREQ_0B Register (06h)

REGISTER	NAME	Default value	Active	Description
FREQ_0B[7:0]	FREQ_B[7:0]	01001110	-	8 LSB of frequency control word B

FSEP1 Register (07h)

	••••)			
REGISTER	NAME	Default	Active	Description
		value		
FSEP1[7:3]	-	-	-	Not used
FSEP1[2:0]	FSEP_MSB[2:0]	000	-	3 MSB of frequency separation control

FSEP0 Register (08h)

REGISTER	NAME	Default	Active	Description
		value		
FSEP0[7:0]	FSEP_LSB[7:0]	01011001	-	8 LSB of frequency separation control

CURRENT Register (09h)

REGISTER	NAME	Default value	Active	Description
CURRENT[7:4]	VCO_CURRENT[3:0]	1100	-	Control of current in VCO core 0000 : 160μA 0001 : 320μA 0010 : 480μA 0011 : 630μA 0100 : 790μA 0101 : 950μA 0101 : 950μA 0111 : 1250μA 1000 : 1560μA, use for f< 500 MHz 1001 : 1720μA 1010 : 1870μA 1011 : 2030μA 1100 : 2180μA 1101 : 2340μA 1111 : 2640μA, use for f>500 MHz
CURRENT[3:2]	-	-		Not used
CURRENT[1:0]	PA_DRIVE[1:0]	10		Control of current in VCO buffer for PA 00 : 1mA 01 : 2mA, use for TX, f<500 MHz 10 : 3mA 11 : 4mA, use for TX, f>500 MHz

XOSC Register (0Ah)

			A (*	
REGISTER	NAME	Default	Active	Description
		value		
XOSC[7:1]	-	-	-	Not used
XOSC[0]	XOSC_BYPASS	0	-	0 : Internal XOSC enabled
				1 : Power-Down of XOSC, external CLK used

PA_POW Register (0Bh)

REGISTER	NAME	Default value	Active	Description
PA_POW[7:4]	PA_HIGHPOWER[3:0]	0000	-	Control of output power in high power array. Should be 0000 in PD mode . See Table 3 page 25 for details.
PA_POW[3:0]	PA_LOWPOWER[3:0]	1111	-	Control of output power in low power array Should be 0000 in PD mode. See Table 3 page 25 for details.

PLL Register (0Ch)

REGISTER	NAME	Default value	Active	Description
PLL[7]	EXT_FILTER	0	-	1 : External loop filter 0 : Internal loop filter
				1-to-0 transition samples F_COMP comparator when BREAK_LOOP=1 (TEST3)
PLL[6:3]	REFDIV[3:0]	0010	-	Reference divider
				0000 : Not allowed
				0001 : Not allowed
				0010 : Divide by 2
				0011 : Divide by 3
				1111 : Divide by 15
PLL[2]	ALARM_DISABLE	0	h	0 : Alarm function enabled
				1 : Alarm function disabled
PLL[1]	ALARM_H	-	-	Status bit for tuning voltage out of range (too close to VDD)
PLL[0]	ALARM_L	-	-	Status bit for tuning voltage out of range (too close to GND)

LOCK Register (0Dh)

REGISTER	NAME	Default value	Active	Description
LOCK[7:4]	LOCK_SELECT[3:0]	0000	-	Selection of signals to CHP_OUT (LOCK) pin 0000 : Normal, pin can be used as CHP_OUT 0001 : LOCK_CONTINUOUS (active high) 0010 : LOCK_INSTANT (active high) 0011 : ALARM_H (active high) 0100 : ALARM_L (active high) 0101 : CAL_COMPLETE (active high) 0110 : Not used 0111 : REFERENCE_DIVIDER Output 1000 : TX_PDB (active high, activates external PA when TX_PD=0) 1001 : Not used 1010 : Not used 1011 : Not used 1100 : Not used 1101 : Not used 1101 : Not used 1110 : N_DIVIDER Output 1111 : F_COMP
LOCK[3]	PLL_LOCK_ ACCURACY	0	-	0 : Sets Lock Threshold = 127, Reset Lock Threshold = 111. Corresponds to a worst case accuracy of 0.7% 1 : Sets Lock Threshold = 31, Reset Lock Threshold =15. Corresponds to a worst case accuracy of 2.8%
LOCK[2]	PLL_LOCK_ LENGTH	0	-	0 : Normal PLL lock window 1 : Not used
LOCK[1]	LOCK_INSTANT	-	-	Status bit from Lock Detector
LOCK[0]	LOCK_CONTINUOUS	-	-	Status bit from Lock Detector

CAL Register (0Eh)

REGISTER	NAME	Default value	Active	Description
CAL[7]	CAL_START	0	Ť	 ↑ 1 : Calibration started 0 : Calibration inactive CAL_START must be set to 0 after calibration is done
CAL[6]	CAL_DUAL	0	Н	1 : Store calibration in both A and B 0 : Store calibration in A or B defined by MAIN[6]
CAL[5]	CAL_WAIT	0	Н	 1 : Normal Calibration Wait Time 0 : Half Calibration Wait Time The calibration time is proportional to the internal reference frequency. 2 MHz reference frequency gives 14 ms wait time.
CAL[4]	CAL_CURRENT	0	Н	1 : Calibration Current Doubled 0 : Normal Calibration Current
CAL[3]	CAL_COMPLETE	0	Н	Status bit defining that calibration is complete
CAL[2:0]	CAL_ITERATE	101	Н	Iteration start value for calibration DAC 000 - 101: Not used 110 : Normal start value 111 : Not used

MODEM0 Register (11h)

REGISTER	NAME	Default value	Active	Description
MODEM0[7]	-	-	-	Not used
MODEM0[6:4]	BAUDRATE[2:0]	010	-	000 : 0.6 kBaud 001 : 1.2 kBaud 010 : 2.4 kBaud 011 : 4.8 kBaud 100 : 9.6 kBaud 101 : 19.2 kBaud 110 : 38.4 kBaud 111 : 76.8 kBaud
MODEM0[3:2]	DATA_FORMAT[1:0]	01	-	00 : NRZ operation. 01 : Manchester operation 10 : Transparent Asyncronous UART operation 11 : Not used
MODEM0[1:0]	XOSC_FREQ[1:0]	00	-	Selection of XTAL frequency range 00 : 3MHz - 4MHz crystal, 3.6864MHz recommended 01 : 6MHz - 8MHz crystal, 7.3728MHz recommended 10 : 9MHz - 12MHz crystal, 11.0592 MHz recommended 11 : 12MHz - 16MHz crystal, 14.7456MHz recommended

FSCTRL Register (13h)

REGISTER	NAME	Default	Active	Description		
		value				
FSCTRL[7:4]	-	-	-	Not used		
FSCTRL[3:1]				Reserved		
FSCTRL[0]	FS_RESET_N	1	L	Separate reset of frequency synthesizer		

PRESCALER Register (1Ch)

REGISTER	NAME	Default value	Active	Description
PRESCALER[7:6]	PRE_SWING[1:0]	00	-	Prescaler swing. Fractions for PRE_CURRENT[1:0] = 00 00 : 1 * Nominal Swing 01 : 2/3 * Nominal Swing 10 : 7/3 * Nominal Swing 11 : 5/3 * Nominal Swing
PRESCALER[5:4]	PRE_CURRENT [1:0]	00	-	Prescaler current scaling 00 : 1 * Nominal Current 01 : 2/3 * Nominal Current 10 : 1/2 * Nominal Current 11 : 2/5 * Nominal Current
PRESCALER[3]	BYPASS_R	0	Н	Bypass the resistor in the PLL loop filter 0 : Not bypassed 1 : Bypassed
PRESCALER[2]	DISCONNECT_C	0	-	Disconnect the capacitor in the PLL loop filter 0 : Capacitor connected 1 : Capacitor disconnected. Use for data rate 38.4 and 76.8 kBaud only.
PRESCALER[1:0]	-	-	-	Not used

TEST6 Register (for test only, 40h)

REGISTER	NAME	Default value	Active	Description
TEST6[7]	LOOPFILTER_TP1	0	-	1 : Select testpoint 1 to CHP_OUT 0 : CHP_OUT tied to GND
TEST6 [6]	LOOPFILTER_TP2	0	-	1 : Select testpoint 2 to CHP_OUT 0 : CHP_OUT tied to GND
TEST6 [5]	CHP_OVERRIDE	0	-	1 : use CHP_CO[4:0] value 0 : use calibrated value
TEST6[4:0]	CHP_CO[4:0]	10000	-	Charge_Pump Current DAC override value

TEST5 Register (for test only, 41h)

REGISTER	NAME	Default value	Active	Description
TEST5[7:6]	-	-	-	Not used
TEST5[5]	CHP_DISABLE	0	-	1 : CHP up and down pulses disabled 0 : normal operation
TEST5[4]	VCO_OVERRIDE	0	-	1 : use VCO_AO[3:0] value 0 : use calibrated value
TEST5[3:0]	VCO_AO[3:0]	1000	-	VCO_ARRAY override value

TEST4 Register (for test only, 42h)

REGISTER	NAME	Default value	Active	Description
TEST4[7:6]	-	-	-	Not used
TEST4[5:0]	L2KIO[5:0]	100101	h	Constant setting charge pump current scaling/rounding factor. Sets Bandwidth of PLL. Use 3Fh for 38.4 and 76.8 kBaud

TEST3 Register (for test only, 43h)

REGISTER	NAME	Default value	Active	Description
TEST3[7:5]	-	-	-	Not used
TEST3[4]	BREAK_LOOP	0	-	1 : PLL loop open 0 : PLL loop closed
TEST3[3:0]	CAL_DAC_OPEN	0100	-	Calibration DAC override value, active when BREAK_LOOP =1

TEST2 Register (for test only, 44h)

REGISTER	NAME	Default value	Active	Description
TEST2[7:5]	-	-	-	Not used
TEST2[4:0]	CHP_CURRENT [4:0]	-	-	Status vector defining applied CHP_CURRENT value

TEST1 Register (for test only, 45h)

REGISTER	NAME	Default	Active	Description
		value		
TEST1[7:4]	-	-	-	Not used
TEST1[3:0]	CAL_DAC[3:0]	-	-	Status vector defining applied Calibration
				DAC value

TEST0 Register (for test only, 46h)

REGISTER	NAME	Default value	Active	Description
TEST0[7:4]	-	-	-	Not used
TEST0[3:0]	VCO_ARRAY[3:0]	-	-	Status vector defining applied VCO_ARRAY value

CC1050

Package Description (TSSOP-24)

Note: The figure is an illustration only.

Thin Shrink Small Outline Package (TSSOP)											
		D	E1	E	А	A1	Е	В	L	Copl.	α
TSSOP 24	Min	7.7	4.30			0.05		0.19	0.45		0°
				6.40			0.65				
	Max	7.9	4.50		1.20	0.15		0.30	0.75	0.10	8°
Max 7.9 4.50 1.20 0.15 0.30 0.75 0.10 8° All dimensions in mm											

Soldering Information

Recommended soldering profile is according to IPC/JEDEC J-STD-020B, July 2002.

Plastic Tube Specification

TSSOP 4.4mm (.173") antistatic tube.

Tube Specification					
Package	Tube Width	Tube Height	Tube	Units per Tube	
			Length		
TSSOP 24	268 mil	80 mil	20"	62	

Carrier Tape and Reel Specification

Carrier tape and reel is in accordance with EIA Specification 481.

Tape and Reel Specification					
Package	Tape Width	Component	Hole	Reel	Units per Reel
		Pitch	Pitch	Diameter	
TSSOP 24	16 mm	8 mm	4 mm	13"	2500

Ordering Information

Ordering part number	Description	MOQ
CC1050	Single Chip RF Transceiver	62 (tube)
CC1050/T&R	Single Chip RF Transceiver	2500 (tape and reel)
CC1050DK-433	CC1050 Development Kit, 433 MHz	1
CC1050DK-868	CC1050 Development Kit, 868/915 MHz	1
CC1050SK	CC1050 Sample Kit (5 pcs)	1

MOQ = Minimum Order Quantity

General Information

Document Revision History

Revision	Date	Description/Changes
1.1	April 2004	Shaping feature removed
		L1 changed to 0603 size
		Crystal oscillator information added
		Preliminary version removed
		Minor corrections and editorial changes
1.2	August 2004	Application circuit and BOM simplified
		Description in the FSCTRL register changed
		KOA inductor removed in BOM
		Additional information on LC-filter

Disclaimer

Chipcon AS believes the information contained herein is correct and accurate at the time of this printing. However, Chipcon AS reserves the right to make changes to this product without notice. Chipcon AS does not assume any responsibility for the use of the described product; neither does it convey any license under its patent rights, or the rights of others. The latest updates are available at the Chipcon website or by contacting Chipcon directly.

To the extent possible, major changes of product specifications and functionality will be stated in product specific Errata Notes published at the Chipcon website. Customers are encouraged to sign up for the Developer's Newsletter for the most recent updates on products and support tools.

When a product is discontinued this will be done according to Chipcon's procedure for obsolete products as described in Chipcon's Quality Manual. This includes informing about last-time-buy options. The Quality Manual can be downloaded from Chipcon's website.

Trademarks

SmartRF[®] is a registered trademark of Chipcon AS. SmartRF[®] is Chipcon's RF technology platform with RF library cells, modules and design expertise. Based on SmartRF[®] technology Chipcon develops standard component RF circuits as well as full custom ASICs based on customer requirements and this technology.

All other trademarks, registered trademarks and product names are the sole property of their respective owners.

Life Support Policy

This Chipcon product is not designed for use in life support appliances, devices, or other systems where malfunction can reasonably be expected to result in significant personal injury to the user, or as a critical component in any life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness. Chipcon AS customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Chipcon AS for any damages resulting from any improper use or sale.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию.

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России, а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научноисследовательскими институтами России.

С нами вы становитесь еще успешнее!
