Data Sheet

Description

The ACNV3130 contains an AlGaAs LED, which is optically coupled to an integrated circuit with a power output stage. This optocoupler is ideally suited for driving power IGBTs and MOSFETs used in motor control inverter applications. The high operating voltage range of the output stage provides the drive voltages required by gate controlled devices. The voltage and high peak output current supplied by this optocoupler can be used to drive a discrete power stage make it ideally suited for direct driving IGBT with ratings up to 1700V/100A. For IGBTs with higher ratings, this optocoupler can be used to drive a discrete power stage which drives the IGBT gate. The ACNV3130 has the highest insulation voltage of $V_{IORM} = 2262$ Vpeak in the IEC/ EN/DIN EN 60747-5-5.

Notes:

1. All Avago data sheets report the creepage and clearance inherent to the optocoupler component itself. These dimensions are needed as a starting point for the equipment designer when determining the circuit insulation requirements. However, once mounted on a printed circuit board, minimum creepage and clearance requirements must be met as specified for individual equipment standards. For creepage, the shortest distance path along the surface of a printed circuit board between the solder fillets of the input and output leads must be considered (the recommended Land Pattern does not necessarily meet the minimum creepage of the device). There are recommended techniques such as grooves and ribs which may be used on a printed circuit board to achieve desired creepage and clearances. Creepage and clearance distances will also change depending on factors such as pollution degree and insulation level.

Notes:

1. Derate linearly above 70°C free-air temperature at a rate of $0.3 \text{ mA}/^\circ\text{C}$.
2. Maximum pulse width = $10\mu\text{s}$. This value is intended to allow for component tolerances for designs with I_{OH} peak minimum = 2.0 A. See applications section for additional details on limiting I_{OH} peak.
3. Derate linearly above 85°C free-air temperature at a rate of $-18.7 \text{ mW}/^\circ\text{C}$ (TBD)
4. Derate linearly above 85°C free-air temperature at a rate of $-14.1 \text{ mW}/^\circ\text{C}$ (TBD). The maximum LED junction temperature should not exceed 125°C .
5. Maximum pulse width = $50 \mu\text{s}$.
6. In this test V_{OH} is measured with a dc load current. When driving capacitive loads, V_{OH} will approach V_{CC} as I_{OH} approaches zero amps.
7. Maximum pulse width = 1 ms.
8. Pulse Width Distortion (PWD) is defined as $|t_{PHL}-t_{PLH}|$ for any given device.
9. The difference between t_{PHL} and t_{PLH} between any two ACNV3130 parts under the same test condition.
10. Pin 1, 4 and 5 need to be connected to LED common.
11. Common mode transient immunity in the high state is the maximum tolerable dV_{CM}/dt of the common mode pulse, V_{CM} , to assure that the output will remain in the high state (i.e., $V_O > 15.0 \text{ V}$).
12. Common mode transient immunity in a low state is the maximum tolerable dV_{CM}/dt of the common mode pulse, V_{CM} , to assure that the output will remain in a low state (i.e., $V_O < 1.0 \text{ V}$).
13. In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 9000 \text{ Vrms}$ for 1 second (leakage detection current limit, $I_{L-O} \mu 5 \mu\text{A}$).
14. Device considered a two-terminal device: pins 1, 2, 3, 4 and 5 shorted together and pins 6, 7, 8, 9 and 10 shorted together.
15. The device was mounted on a high conductivity test board as per JEDEC 51-7.

R₁₂: Junction to Ambient Thermal Resistance of LED due to heating of Detector (Output IC)

R₂₁: Junction to Ambient Thermal Resistance of Detector (Output IC) due to heating of LED.

R₂₂: Junction to Ambient Thermal Resistance of Detector (Output IC) due to heating of Detector (Output IC).

P₁: Power dissipation of LED (W).

P₂: Power dissipation of Detector / Output IC (W).

T₁: Junction temperature of LED (°C).

T₂: Junction temperature of Detector (°C).

T_A: Ambient temperature.

Ambient Temperature: Junction to Ambient Thermal Resistances were measured approximately 1.25 cm above optocoupler at ~23 °C in still air

Thermal Resistance	°C/W
R ₁₁	118.5
R ₁₂	11.6
R ₂₁	14
R ₂₂	55.5

This thermal model assumes the device is soldered onto a high conductivity board as per JEDEC 51-7. The temperature at the LED and Detector junctions of the optocoupler can be calculated using the equations below.

$$T_1 = (R_{11} * P_1 + R_{12} * P_2) + T_A \quad \text{-- (1)}$$

$$T_2 = (R_{21} * P_1 + R_{22} * P_2) + T_A \quad \text{-- (2)}$$

Using the given thermal resistances and thermal model formula in this datasheet, we can calculate the junction temperature for both LED and the output detector. Both junction temperatures should be within the absolute maximum rating of 125°C.
