

## Pop-free 120 mW stereo headphone amplifier

### Features

- Pop and click noise protection circuitry
- Operating range from  $V_{CC} = 2.2\text{ V}$  to  $5.5\text{ V}$
- Standby mode active low
- Output power:
  - 120 mW at 5 V, into  $16\ \Omega$  with 0.1% THD+N max. (1 kHz)
  - 55 mW at 3.3 V, into  $16\ \Omega$  with 0.1% THD+N max. (1 kHz)
- Low current consumption: 2.7 mA max. at 5 V
- Ultra-low standby current consumption: 10 nA typical
- High signal-to-noise ratio
- High crosstalk immunity: 102 dB ( $F = 1\text{ kHz}$ )
- PSRR: 70 dB typ. ( $F = 1\text{ kHz}$ ), inputs grounded at 5 V
- Unity-gain stable
- Short-circuit protection circuitry
- Available in DFN8 2x2 mm

### Applications

- Headphone amplifiers
- Mobile phones, PDAs, computer motherboards
- High-end TVs, portable audio players

### Description

The **TS488** is a dual audio power amplifier capable of driving, in single-ended mode, either a  $16\ \Omega$  or a  $32\ \Omega$  stereo headset.

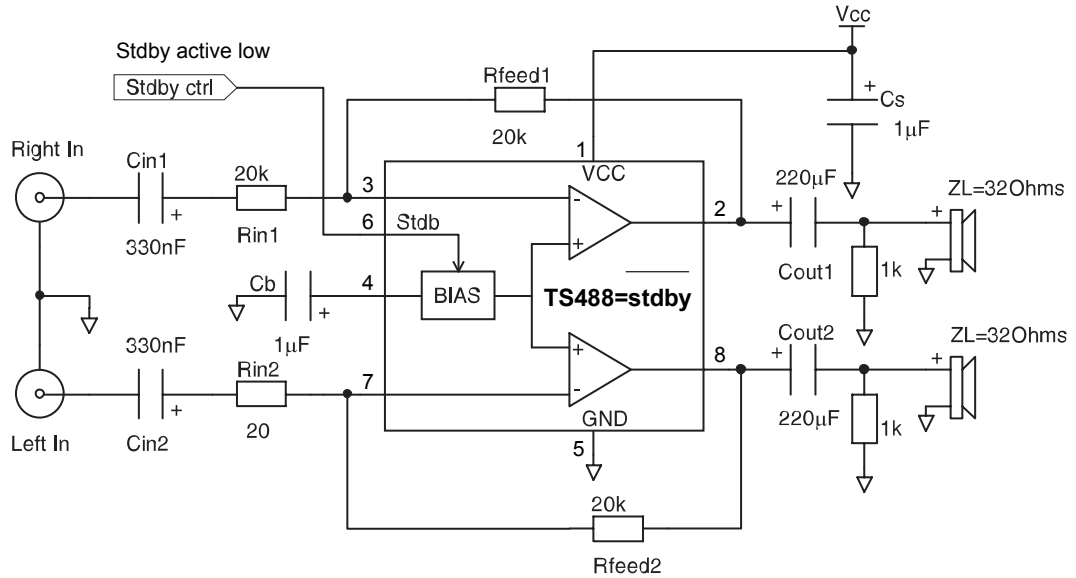

The **TS488** eliminates pop and click noise and reduces the number of required external passive components.

Capable of descending to low voltages, it delivers up to 31 mW per channel (into  $16\ \Omega$  loads) of continuous average power with 0.1% THD+N in the audio bandwidth from a 2.5 V power supply.

An externally-controlled standby mode reduces the supply current to 10 nA (typ.). The unity gain stable is configured by external gain-setting resistors.

Product status link	
TS488	
Product summary	
Order code	TS488IQT
Temperature range	-40 to +85 °C
Package	DFN8 2x2 mm
Packing	Tape and reel
Marking	K88

# 1 Typical application schematic

**Figure 1. Typical application for the TS488**

**Table 1. Application component information**

Component	Functional description
$R_{in1,2}$	Inverting input resistor that sets the closed loop gain in conjunction with $R_{feed}$ . This resistor also forms a high pass filter with $C_{in}$ [ $F_c = 1 / (2 \times \pi \times R_{in} \times C_{in})$ ]
$C_{in1,2}$	Input coupling capacitor that blocks the DC voltage at the amplifier input terminal
$R_{feed1,2}$	Feedback resistor that sets the closed loop gain in conjunction with $R_{in}$ . $A_v =$ closed loop gain = $-R_{feed}/R_{in}$
$C_s$	Supply output capacitor that provides power supply filtering
$C_b$	Bypass capacitor that provides half supply filtering
$C_{out1,2}$	Output coupling capacitor that blocks the DC voltage at the load input terminal. This capacitor also forms a high pass with $R_L$ [ $F_c = 1 / (2 \times \pi \times R_L \times C_{out})$ ]

## 2 Absolute maximum ratings

**Table 2. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	6	V
$V_i$	Input voltage	-0.3 V to $V_{CC} + 0.3$ V	V
$T_{stg}$	Storage temperature	-65 to +150	°C
$T_j$	Maximum junction temperature	150	°C
$R_{thja}$	Thermal resistance junction-to-ambient	70	°C/W
$P_{diss}$	Power dissipation <sup>(2)</sup>	1.79	W
ESD	Human body model (pin to pin)	2	kV
	Machine mode I220 pF - 240 pF (pin-to-pin)	200	V
	200	V	
Latch-up	Latch-up immunity (all pins)	200	mA
	Lead temperature (soldering, 10 s)	250	°C
	Output short-circuit to VCC or GND	continuous <sup>(3)</sup>	

- All voltage values are measured with respect to the ground pin.
- $P_{diss}$  is calculated with  $T_{amb} = 25$  °C,  $T_j = 150$  °C.
- Attention must be paid to continuous power dissipation ( $V_{DD} \times 250$  mA). Short-circuits can cause excessive heating and destructive dissipation. Exposing the IC to a short-circuit for an extended period of time dramatically reduces the product's life expectancy.

**Table 3. Operational data**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	2.2 to 5.5	V
$R_L$	Load resistor	$\geq 16$	$\Omega$
$T_{oper}$	Operating free air temperature range	-40 to + 85	°C
$C_L$	Load capacitor: $R_L = 16$ to $100 \Omega$	400	pF
	$R_L > 100 \Omega$	100	
$V_{STBY}$	TS488 active	$1.5 \leq V \leq V_{CC}$	V
	TS488 in standby	$GND \leq V_{STBY} \leq 0.4^{(1)}$	
$R_{thja}$	Thermal resistance junction-to-ambient: DFN8 <sup>(2)</sup>	40	°C/W

- The minimum current consumption ( $I_{STBY}$ ) is guaranteed at GND for the whole temperature range.
- When mounted on a 4-layer PCB.

### 3 Electrical characteristics

**Table 4. Electrical characteristics at  $V_{CC}=+5$  V with  $GND=0$  V,  $T_{amb}=25$  °C (unless otherwise specified)**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$I_{CC}$	Supply current	No input signal, no load		2	2.7	mA
$I_{STBY}$	Standby current	No input signal, $V_{STBY} = GND$ $R_L = 32 \Omega$		10	1000	nA
$P_{out}$	Output power	THD+N = 0.1% max., F = 1 kHz, $R_L = 32 \Omega$		75		mW
		THD+N = 1% max. F = 1 kHz, $R_L = 32 \Omega$	70	80		
		THD+N = 0.1% max., F = 1 kHz, $R_L = 16 \Omega$		120		
		THD+N = 1% max., F = 1 kHz, $R_L = 16 \Omega$	100	130		
THD+N	Total harmonic distortion + noise	$A_V=-1$ , $R_L = 32 \Omega$ , $P_{out} = 60$ mW, $20 \text{ Hz} \leq F \leq 20 \text{ kHz}$		0.3		%
		$A_V=-1$ , $R_L = 16 \Omega$ , $P_{out} = 90$ mW, $20 \text{ Hz} \leq F \leq 20 \text{ kHz}$		0.3		
PSRR	Power supply rejection ratio, inputs grounded <sup>(1)</sup>	$A_V=-1$ , $R_L \geq 16 \Omega$ , $C_b=1 \mu\text{F}$ , F = 1 kHz, $V_{ripple} = 200$ mVpp	64	70		dB
		$A_V=-1$ , $R_L \geq 16 \Omega$ , $C_b=1 \mu\text{F}$ , F = 217 kHz, $V_{ripple} = 200$ mVpp	62	68		
$V_O$	Output swing	$V_{OL}$ : $R_L = 32 \Omega$		0.23	0.31	V
		$V_{OH}$ : $R_L = 32 \Omega$	4.53	4.72		
		$V_{OL}$ : $R_L = 16 \Omega$		0.44	0.57	
		$V_{OH}$ : $R_L = 16 \Omega$	4.18	4.48		
SNR	Signal-to-noise ratio	A-weighted, $A_V=-1$ , $R_L = 32 \Omega$ , THD+N < 0.4%, $20 \text{ Hz} \leq F \leq 20 \text{ kHz}$		105		dB
Crosstalk	Channel separation	$R_L = 32 \Omega$ , $A_V = -1$ , F = 1 kHz, F = 20 Hz to 20 kHz		-102		dB
		$R_L = 32 \Omega$ , $A_V = -1$ , F = 1 kHz, F = 20 Hz to 20 kHz		-84		
$C_i$	Input capacitance			1		pF
GBP	Gain bandwidth product	$R_L = 32 \Omega$		1.1		MHz
SR	Slew rate, unity gain inverting	$R_L = 16 \Omega$		0.65		V/ $\mu\text{s}$
$V_{IO}$	Input offset voltage	$V_{icm}=V_{CC}/2$		1	20	mV
$t_{wu}$	Wake-up time			100		ms

1. Guaranteed by design and evaluation.

**Table 5. Electrical characteristics at  $V_{CC}=+3.3$  V with  $GND=0$  V,  $T_{amb}=25$  °C (unless otherwise specified)**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$I_{CC}$	Supply current	No input signal, no load		1.8	2.5	mA
$I_{STBY}$	Standby current	No input signal, $V_{STBY} = GND$ $R_L = 32 \Omega$		10	1000	nA
$P_{out}$	Output power	THD+N = 0.1% max., $F = 1$ kHz, $R_L = 32 \Omega$		34		mW
		THD+N = 1% max. $F = 1$ kHz, $R_L = 32 \Omega$	30	35		
		THD+N = 0.1% max., $F = 1$ kHz, $R_L = 16 \Omega$		55		
		THD+N = 1% max, $F = 1$ kHz, $R_L = 16 \Omega$	47	57		
THD+N	Total harmonic distortion + noise	$A_V=-1$ , $R_L = 32 \Omega$ , $P_{out} = 16$ mW, $20 \text{ Hz} \leq F \leq 20$ kHz		0.3		%
		$A_V=-1$ , $R_L = 16 \Omega$ , $P_{out} = 35$ mW, $20 \text{ Hz} \leq F \leq 20$ kHz		0.3		
PSRR	Power supply rejection ratio, inputs grounded <sup>(1)</sup>	$A_V=-1$ , $R_L \geq 16 \Omega$ , $C_b=1 \mu\text{F}$ , $F = 1$ kHz, $V_{ripple} = 200$ mVpp	63	69		dB
		$A_V=-1$ , $R_L \geq 16 \Omega$ , $C_b=1 \mu\text{F}$ , $F = 217$ kHz, $V_{ripple} = 200$ mVpp	61	67		
$V_O$	Output swing	$V_{OL}$ : $R_L = 32 \Omega$		0.15	0.2	V
		$V_{OH}$ : $R_L = 32 \Omega$	3.03	3.12		
		$V_{OL}$ : $R_L = 16 \Omega$		0.28	0.36	
		$V_{OH}$ : $R_L = 16 \Omega$	2.82	2.97		
SNR	Signal-to-noise ratio	A-weighted, $A_V=-1$ , $R_L = 32 \Omega$ , THD+N < 0.4%, $20 \text{ Hz} \leq F \leq 20$ kHz		102		dB
Crosstalk	Channel separation	$R_L = 32 \Omega$ , $A_V = -1$ , $F = 1$ kHz, $F = 20$ Hz to 20 kHz		-102		dB
		$R_L = 32 \Omega$ , $A_V = -1$ , $F = 1$ kHz, $F = 20$ Hz to 20 kHz		-84		dB
$C_i$	Input capacitance			1		pF
GBP	Gain bandwidth product	$R_L = 32 \Omega$		1.1		MHz
SR	Slew rate, unity gain inverting	$R_L = 16 \Omega$		0.6		V/ $\mu\text{s}$
$V_{IO}$	Input offset voltage	$V_{icm}=V_{CC}/2$		1	20	mV
$t_{wu}$	Wake-up time			100		ms

1. Guaranteed by design and evaluation.

Note: All electrical values are guaranteed with correlation measurements at 2.5 V and 5 V.

## 5 Application information

### 5.1 Power dissipation and efficiency

Hypotheses:

- Voltage and current in the load are sinusoidal ( $V_{out}$  and  $I_{out}$ )
- Supply voltage is a pure DC source ( $V_{CC}$ )

Regarding the load, we have:

$$V_{OUT} = V_{PEAK} \sin \omega t (V) \quad (1)$$

and

$$I_{OUT} = \frac{V_{OUT}}{R_L} (A) \quad (2)$$

and

$$P_{OUT} = \frac{V_{PEAK}^2}{2R_L} (A) \quad (3)$$

The average current delivered by the power supply voltage is:

$$I_{CC_{AVG}} = \frac{1}{2\pi} \int_0^{\pi} \frac{V_{PEAK}}{R_L} \sin(t) dt = \frac{V_{PEAK}}{\pi R_L} (A) \quad (4)$$

**Figure 74. Current delivered by power supply voltage in single-ended configuration**

The power delivered by power supply voltage is:

$$P_{supply} = V_{CC} I_{CC_{AVG}} (W) \quad (5)$$

So, the power dissipation by each power amplifier is:

$$P_{diss} = P_{supply} - P_{OUT} (W) \quad (6)$$

$$P_{diss} = \frac{\sqrt{2} V_{CC}}{\pi \sqrt{R_L}} \sqrt{P_{OUT}} - P_{OUT} (W) \quad (7)$$

and the maximum value is obtained when:

$$\frac{\partial P_{diss}}{\partial P_{OUT}} = 0 \quad (8)$$

and its value is:

$$P_{dissMAX} = \frac{V_{CC}^2}{\pi^2 R_L} (W) \quad (9)$$

**Note:** This maximum value depends only on power supply voltage and load values.

The efficiency is the ratio between the output power and the power supply:

$$\eta = \frac{P_{OUT}}{P_{supply}} = \frac{\pi V_{peak}}{2V_{CC}} \quad (10)$$

The maximum theoretical value is reached when  $V_{peak} = V_{CC}/2$ , so

$$\eta = \frac{\pi}{4} = 78.5\% \quad (11)$$

## 5.2 Total power dissipation

The TS488 is stereo (dual channel) amplifier. It has two independent power amplifiers. Each amplifier produces heat due to its power dissipation. Therefore the maximum die temperature is the sum of each amplifier's maximum power dissipation. It is calculated as follows:

- $P_{diss R}$  = power dissipation due to the right channel power amplifier
- $P_{diss L}$  = power dissipation due to the left channel power amplifier
- Total  $P_{diss} = P_{diss R} + P_{diss L}$  (W)

Typically,  $P_{diss R}$  is equal to  $P_{diss L}$ , giving:

$$\begin{aligned} TotalP_{diss} &= 2P_{dissR} = 2P_{dissL} \\ TotalP_{diss} &= \frac{2\sqrt{2}V_{CC}}{\pi\sqrt{R_L}}\sqrt{P_{OUT}} - 2P_{OUT} \end{aligned} \quad (12)$$

## 5.3 Lower cut-off frequency

The lower cut-off frequency  $F_{CL}$  of the amplifier depends on input capacitors  $C_{in}$  and output capacitors  $C_{out}$ .

The input capacitor  $C_{in}$  (output capacitor  $C_{out}$ ) in serial with the input resistor  $R_{in}$  (load resistor  $R_L$ ) of the amplifier is equivalent to a first order high pass filter. Assuming that  $F_{CL}$  is the lowest frequency to be amplified (with a 3 dB attenuation), the minimum value of the  $C_{in}$  ( $C_{out}$ ) is:

$$\begin{aligned} C_{in} &= \frac{1}{2\pi \cdot F_{CL} \cdot R_{in}} \\ C_{out} &= \frac{1}{2\pi \cdot F_{CL} \cdot R_L} \end{aligned} \quad (13)$$

**Figure 75. Lower cut-off frequency vs. input capacitor**

**Figure 76. Lower cut-off frequency vs. output capacitor**

*Note:* In case  $F_{CL}$  is kept the same for calculation, it must be taken in account that the 1<sup>st</sup> order high-pass filter on the input and the 1<sup>st</sup> order high-pass filter on the output create a 2<sup>nd</sup> order high-pass filter in the audio signal path with an attenuation 6 dB on  $F_{CL}$  and a roll-off 40 dB/decade.

## 5.4 Higher cut-off frequency

In the high-frequency region, you can limit the bandwidth by adding a capacitor  $C_{feed}$  in parallel with  $R_{feed}$ . It forms a low-pass filter with a -3 dB cut-off frequency  $F_{CH}$ . Assuming that  $F_{CH}$  is the highest frequency to be amplified (with a 3 dB attenuation), the maximum value of  $C_{feed}$  is:

$$F_{CH} = \frac{1}{2\pi \cdot R_{feed} \cdot C_{feed}} \quad (14)$$

**Figure 77. Higher cut-off frequency vs. feedback capacitor**

## 5.5 Gain settings

In the flat frequency response region (with no effect from  $C_{in}$ ,  $C_{out}$ ,  $C_{feed}$ ), the output voltage is:

$$V_{OUT} = V_{IN} \cdot \left( -\frac{R_{feed}}{R_{in}} \right) = V_{IN} \cdot A_V \quad (15)$$

The gain  $A_V$  is:

$$A_V = -\frac{R_{feed}}{R_{in}} \quad (16)$$

## 5.6 Decoupling of the circuit

Two capacitors are needed to properly bypass the TS488, a power supply capacitor  $C_s$  and a bias voltage bypass capacitor  $C_b$ .

$C_s$  has a strong influence on the THD+N in the high frequency range (above 7 kHz) and indirectly on the power supply disturbances. With 1  $\mu\text{F}$ , you can expect THD+N performance to be similar to the one shown in the datasheet. If  $C_s$  is lower than 1  $\mu\text{F}$ , the THD+N increases in the higher frequencies and disturbances on the power supply rail are less filtered. On the contrary, if  $C_s$  is higher than 1  $\mu\text{F}$ , the disturbances on the power supply rail are more filtered.

$C_b$  has an influence on the THD+N in the low frequency range. Its value is critical on the PSRR with grounded inputs in the lower frequencies:

- If  $C_b$  is lower than 1  $\mu\text{F}$ , the THD+N improves and the PSRR worsens
- If  $C_b$  is higher than 1  $\mu\text{F}$ , the benefit on the THD+N and PSRR is small

*Note:* The input capacitor  $C_{in}$  also has a significant effect on the PSRR at lower frequencies. The lower the value of  $C_{in}$ , the higher the PSRR.

## 5.7 Decoupling of the circuit

Two capacitors are needed to properly bypass the TS488, a power supply capacitor  $C_s$  and a bias voltage bypass capacitor  $C_b$ .

$C_s$  has a strong influence on the THD+N in the high frequency range (above 7 kHz) and indirectly on the power supply disturbances. With 1  $\mu\text{F}$ , you can expect THD+N performance to be similar to the one shown in the datasheet. If  $C_s$  is lower than 1  $\mu\text{F}$ , the THD+N increases in the higher frequencies and disturbances on the power supply rail are less filtered. On the contrary, if  $C_s$  is higher than 1  $\mu\text{F}$ , the disturbances on the power supply rail are more filtered.

$C_b$  has an influence on the THD+N in the low frequency range. Its value is critical on the PSRR with grounded inputs in the lower frequencies:

- If  $C_b$  is lower than 1  $\mu\text{F}$ , the THD+N improves and the PSRR worsens
- If  $C_b$  is higher than 1  $\mu\text{F}$ , the benefit on the THD+N and PSRR is small

*Note:* The input capacitor  $C_{in}$  also has a significant effect on the PSRR at lower frequencies. The lower the value of  $C_{in}$ , the higher the PSRR.

## 5.8 Standby mode

When the standby mode is activated an internal circuit of the TS488 is charged (see Figure 78. Internal equivalent schematic of the TS488 in standby mode). A time required to change the internal circuit is a few microseconds

Figure 78. Internal equivalent schematic of the TS488 in standby mode

## 5.9 Wake-up time

When the standby is released to put the device ON, the bypass capacitor  $C_b$  is charged immediately. As  $C_b$  is directly linked to the bias of the amplifier, the bias does not work properly until the  $C_b$  voltage is correct. The time to reach this voltage plus a time delay of 20 ms (pop precaution) is called the wake-up time or  $t_{WU}$ ; it is specified in the electrical characteristics table with  $C_b = 1 \mu\text{F}$ .

If  $C_b$  has a value other than 1  $\mu\text{F}$ ,  $t_{WU}$  can be calculated by applying the following formulas or can be read directly from Figure 79. Typical wake-up time vs. bypass capacitance

$$t_{WU} = \frac{C_b \cdot 2.5}{0.03125} + 20[\text{ms}; \mu\text{F}] \quad (17)$$

Figure 79. Typical wake-up time vs. bypass capacitance

Note: It is assumed that the  $C_b$  voltage is equal to 0 V. If the  $C_b$  voltage is not equal to 0 V, the wake-up time is shorter.

## 5.10 POP performance

Pop performance is closely related to the size of the input capacitor  $C_{in}$ . The size of  $C_{in}$  is dependent on the lower cut-off frequency and PSRR values requested.

In order to reach low pop,  $C_{in}$  must be charged to  $V_{CC}/2$  in less than 20 ms. To follow this rule, the equivalent input constant time ( $R_{in}C_{in}$ ) should be less than 6.7 ms:

$$t_{in} = R_{in} \times C_{in} < 0.0067 \text{ (s)}$$

Example calculation:

In the typical application schematic  $R_{in}$  is 20 k $\Omega$  and  $C_{in}$  is 330 nF. The lower cut-off frequency (-3 db attenuation) is given by the following formula

$$F_{CL} = \frac{1}{2\pi \cdot R_{in} \cdot C_{in}} \quad (18)$$

With the values above, the result is  $F_{CL} = 25 \text{ Hz}$ .

In this case,  $t_{in} = R_{in} \times C_{in} = 6.6 \text{ ms}$ .

This value is sufficient with regard to the previous formula, thus we can state that the pop is imperceptible.

### Connecting the headphones

Generally headphones are connected using jack connectors. To prevent a pop in the headphones when plugging in the jack, a pull-down resistor should be connected in parallel with each headphone output. This allows the capacitors  $C_{out}$  to be charged even when the headphones are not plugged in.

Pull-down resistors with a value of 1 k $\Omega$  are high enough to be a negligible load, and low enough to charge the capacitors  $C_{out}$  in less than one second.

Note: The pop&click reduction circuitry works properly only when both channels have the same value for the external components  $C_{in}$ ,  $C_{out}$ ,  $R_{load}$  and  $R_{pull-down}$ .

## 6 Package information

In order to meet environmental requirements, ST offers these devices in different grades of **ECOPACK** packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

## Revision history

**Table 8. Document revision history**

Date	Version	Changes
02-Jan-2006	1	Initial release.
01-Feb-2006	2	Removal of typical application schematic on first page (it appears in Figure 1 on page 3). Minor grammatical and formatting corrections throughout
04-Aug-2006	3	Update of marking. Update of DFN8 package height. Editorial update.
15-Sep-2006	4	Revision corresponding to the release to production of the TS488 - TS489
14-May-2012	5	Removed obsolete part numbers TS489IQT and TS489IST from the cover page and Table 8: Order codes. Updated ECOPACK® text in Section 5: Package mechanical data. Updated package in Section 5.2: DFN8 package.
13-Apr-2017	6	Updated Section 5.2: DFN8 package information: "L" dimension changed from 0.5 mm to 0.425 mm. Minor changes throughout the document.
17-Apr-2019	7	Removed the part number TS489 and all its references.
06-May-2020	8	Updated <a href="#">Figure 1. Typical application for the TS488</a> .

## Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
