

TPS2559-Q1

SLVSD03-DECEMBER 2015

# TPS2559-Q1 Precision Adjustable Current-Limited Power-Distribution Switch

### **Features**

- Qualified for Automotive Applications AEC-Q100 Qualified With the Following Results:
  - Device HBM ESD Classification Level H2
  - Device CDM ESD Classification Level C5
- 2.5 to 6.5 V Operating Range
- Adjustable 1.2 to 4.7 A  $I_{(LIMIT)}$  (±4.7% at 4.7 A)
- 3.5 µs Short Circuit Shutoff (Typical)
- 13-mΩ High-Side MOSFET
- 2-µA Maximum Standby Supply Current
- **Built-in Soft-Start**
- Reverse Current Blocking when Disabled
- 8 kV / 15 kV System-Level ESD Capable
- 10-Pin SON (3-mm × 3-mm) Package with Wettable Flanks

# **Applications**

- Automotive USB Ports/Hubs
- Automotive Internal Load Switch

# 3 Description

TPS2559-Q1 power-distribution intended for applications where a low resistance, precision current limit switch is required or heavy capacitive loads are encountered. The TPS2559-Q1 provides up to 5.5 A of continuous load current with a precise current limit set by a single resistor to ground. Output current is maintained at a safe level by switching into a constant-current mode when the output load exceeds the current-limit threshold. During overload events the output current is limited to the level set by  $R_{(ILIM)}$ . If a persistent overload occurs, the device goes into thermal shutoff to prevent damage to the TPS2559-Q1.

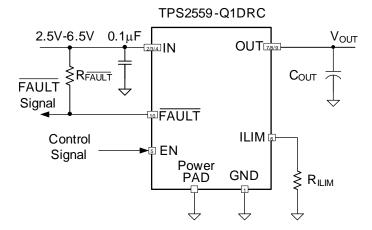

The power-switch rise and fall times are controlled to minimize current surges during turn on or off. The FAULT logic output asserts low during overcurrent or overtemperature conditions.

# 6 Pin Configuration and Functions

#### **Pin Functions**

PIN		TYPE	DESCRIPTION
NAME	NO.	ITPE	DESCRIPTION
GND	1		Ground connection, connect externally to PowerPAD
IN	2,3,4	I	Input voltage, connect a 0.1 $\mu\text{F}$ or greater ceramic capacitor from IN to GND as close to the IC as possible
EN	5	1	Enable input, logic high turns on power switch.
ILIM	6	0	External resistor used to set current-limit threshold; recommended. 24.9 k $\Omega$ ≤ R <sub>(ILIM)</sub> ≤ 100 k $\Omega$ .
OUT	7,8,9	0	Power-switch output
FAULT	10	0	Active-low open-drain output, asserted during over-current or overtemperature conditions.
PowerPAD™	PAD		Internally connected to GND; used to heat-sink the part to the circuit board traces. Connect PowerPAD to GND pin externally.

#### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1) (2)

		MIN	I MAX	UNIT
Voltage range	IN, OUT, EN, ILIM, FAULT	-0.3	3 7	V
	IN to OUT	-7	7	V
Continuous output current, I <sub>OUT</sub>	OUT	In	ternally Limited	mA
Continuous FAULT sink current			20	mA
ILIM source current			ternally Limited	mA
Maximum junction temperature, T <sub>J</sub>			to OTSD2	°C
Storage temperature, T <sub>stg</sub>			150	°C

<sup>(1)</sup> Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Voltages are referenced to GND unless otherwise noted.

#### 7.2 ESD Ratings

				VALUE	UNIT
	Human body model (HBM), ESD stress voltage, all pins (2)			±2000	
Electrostatic	Charged device model (CDM), ESD stress voltage, all pins <sup>(3)</sup>		±750	\/	
V <sub>(ESD)</sub>	discharge <sup>(1)</sup>	Contain Laurel (4)	Contact discharge	±8000	V
		System Level (4)	Air discharge	±15000	

<sup>(1)</sup> Electrostatic discharge (ESD) to measure device sensitivity or immunity to damage caused by assembly-line electrostatic discharges into the device.

#### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V <sub>IN</sub>	Input voltage, IN	2.5	6.5	V
V <sub>EN</sub>	Input voltage, EN	0	6.5	V
I <sub>OUT</sub>	Continuous output current of OUT		5.5	Α
	Continuous FAULT sink current		10	mA
R <sub>(ILIM)</sub>	Recommended resistor limit range (1)	24.9	100	kΩ
TJ	Operating junction temperature	-40	125	°C

<sup>(1)</sup>  $R_{(ILIM)}$  is the resistor from ILIM pin to GND and ILIM pin can be shorted to GND.

#### 7.4 Thermal Information

	THERMAL METRIC <sup>(1)</sup>	TPS2559-Q1

### 9 Detailed Description

#### 9.1 Overview

The TPS2559-Q1 is a current-limited, power-distribution switch using N-channel MOSFETs for applications where short circuits or heavy capacitive loads will be encountered. This device allows the user to program the current-limit via an external resistor and the maximum continuous output current up to 5.5 A. This device incorporates an internal charge pump and the gate drive circuitry necessary to drive the N-channel MOSFET. The charge pump supplies power to the driver circuit and provides the necessary voltage to pull the gate of the MOSFET above the source. The charge pump operates from input voltages as low as 2.5 V and requires little supply current. The driver controls the gate voltage of the power switch. The driver incorporates circuitry that controls the rise and fall times of the output voltage to limit large current and voltage surges and provides built-in soft-start functionality. The TPS2559-Q1 limits the output current to the programmed current-limit threshold I<sub>OS</sub> during an overcurrent or short-circuit event by reducing the charge pump voltage driving the N-channel MOSFET and operating it in the linear range of operation. The result of limiting the output current to I<sub>OS</sub> reduces the output voltage at OUT because N-channel MOSFET is no longer fully enhanced.

#### 9.2 Functional Block Diagram

#### 9.3 Feature Description

#### 9.3.1 Thermal Sense

The TPS2559-Q1 self protects by using two independent thermal sensing circuits that monitor the operating temperature of the power switch and disable operation if the temperature exceeds recommended operating conditions. The TPS2559-Q1 device operates in constant-current mode during an over-current condition, which increases the voltage drop across power switch. The power dissipation in the package is proportional to the voltage drop across the power switch, which increases the junction temperature during an over-current condition. The first thermal sensor (OTSD1) turns off the power switch when the die temperature exceeds 135°C (min) and the part is in current limit. Hysteresis is built into the thermal sensor, and the switch turns on after the device has cooled approximately 20°C.

The TPS2559-Q1 also has a second ambient thermal sensor (OTSD2). The ambient thermal sensor turns off the power switch when the die temperature exceeds 155°C (min) regardless of whether the power switch is in current limit and will turn on the power switch after the device has cooled approximately 20°C. The TPS2559-Q1 continues to cycle off and on until the fault is removed.

www.ti.com

### **Feature Description (continued)**

#### 9.3.2 Overcurrent Protection

The TPS2559-Q1 responds to overcurrent conditions by limiting their output current to IOS. When an overload condition is present, the device maintains a constant output current, with the output voltage determined by ( $I_{OS} \times R_{LOAD}$ ). Two possible overload conditions can occur.

The first condition is when a short circuit or partial short circuit is present when the device is powered-up or enabled. The output voltage is held near zero potential with respect to ground and the TPS2559-Q1 ramps the output current to I<sub>OS</sub>. The TPS2559-Q1 limits the current to I<sub>OS</sub> until the overload condition is removed or the device begins to thermal cycle (see Figure 24).

The second condition is when a short circuit, partial short circuit, or transient overload occurs while the device is enabled and powered on. The device responds to the overcurrent condition within time  $t_{IOS}$  (see Figure 15). The response speed and shape will vary with the overload level, input circuit, and rate of application. The current-limit response will vary between simply settling to  $I_{OS}$ , or turnoff and controlled return to IOS. Similar to the previous case, the TPS2559-Q1 limits the current to  $I_{OS}$  until the overload condition is removed or the device begins to thermal cycle.

The TPS2559-Q1 thermal cycles if an overload condition is present long enough to activate thermal limiting in any of the above cases. The device turns off when the junction temperature exceeds 135°C (min) while in current limit. The device remains off until the junction temperature cools 20°C (typ) and then restarts. The TPS2559-Q1 cycles on/off until the overload is removed (see Figure 25).

#### 9.3.3 FAULT Response

The FAULT open-drain output is asserted (active low) during an over-current or over-temperature condition. The TPS2559-Q1 asserts the FAULT signal until the fault condition is removed and the device resumes normal operation. The TPS2559-Q1 is designed to eliminate false FAULT reporting by using an internal delay "deglitch" circuit for over-current (9-ms typ.) conditions without the need for external circuitry. This ensures that FAULT is not accidentally asserted due to normal operation such as starting into a heavy capacitive load. The deglitch circuitry delays entering and leaving current-limit induced fault conditions. The FAULT signal is not deglitched when the MOSFET is disabled due to an over-temperature condition but is deglitched after the device has cooled and begins to turn on. This unidirectional deglitch prevents FAULT oscillation during an over-temperature event.

#### 9.4 Device Functional Modes

#### 9.4.1 Operation with VIN Undervoltage Lockout (UVLO) Control

The undervoltage lockout (UVLO) circuit disables the power switch until the input voltage reaches the UVLO turnon threshold. Built-in hysteresis prevents unwanted on/off cycling due to input voltage droop during turn on.

### 9.4.2 Operation with EN Control

The logic enable controls the power switch and device supply current. The supply current is reduced to less than 2-µA when a logic low is present on EN. A logic high input on EN enables the driver, control circuits, and power switch. The enable input is compatible with both TTL and CMOS logic levels.

# 10 Application and Implementation

#### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

#### 10.1 Application Information

The TPS2559-Q1 current limited power switch uses N-channel MOSFETs in applications requiring up to 5.5 A of continuous load current. The device enters constant-current mode when the load exceeds the current limit threshold.

The TPS2559-Q1 power switch is used to protect the up-stream power supply when the output is overloaded.

### 10.2 Typical Application

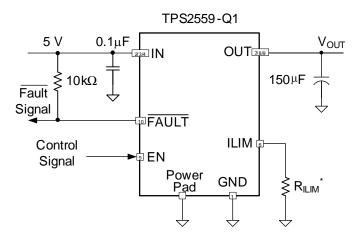

Figure 16. Typical TPS2559-Q1 Power Switch

Use the I<sub>OS</sub> in the *Electrical Characteristics* table or I<sub>OS</sub> in Equation 1 to select the R<sub>ILIM</sub>.

#### 10.2.1 Design Requirements

For this design example, use the following as the input parameters.

DESIGN PARAMETERS	EXAMPLE VALUE
Input Operation Voltage	5 V
Rating Current	3A or 4.5A
Minimum Current Limit	3A
Maximum Current Limit	5A

When choose power switch, there are some several general steps:

- 1. What is the power rail, 3.3 V or 5 V, and then choose the operation range of power switch can cover the power rail.
- 2. What is the normal operation current, for example, the maximum allowable current drawn by portable equipment for USB 2.0 port is 500mA, so the normal operation current is 500mA and the minimum current limit of power switch must exceed 500 mA to avoid false trigger during normal operation.
- 3. What is the maximum allowable current provided by up-stream power, and then decide the maximum current limit of power switch that must lower it to ensure power switch can protect the up-stream power when overload is encountered at the output of power switch.

#### NOTE

Choosing power switch with tighter current limit tolerance can loosen the up-stream power supply design.

#### 10.2.2 Detailed Design Procedure

#### 10.2.2.1 Step by Step Design Procedure

To begin the design process a few parameters must be decided upon. The designer needs to know the following:

- Normal Input Operation Voltage
- Rating Current
- Minimum Current Limit
- Maximum Current Limit

#### 10.2.2.2 Input and Output Capacitance

Input and output capacitance improves the performance of the device; the actual capacitance should be optimized for the particular application. For all applications, a  $0.1\mu F$  or greater ceramic bypass capacitor between IN and GND is recommended as close to the device as possible for local noise decoupling. This precaution reduces ringing on the input due to power-supply transients. Additional input capacitance may be needed on the input to reduce voltage undershoot from exceeding the UVLO of other load share one power rail with TPS2559-Q1 or overshoot from exceeding the absolute-maximum voltage of the device during heavy transient conditions. This is especially important during bench testing when long, inductive cables are used to connect the evaluation board to the bench power supply.

Output capacitance is not required, but placing a high-value electrolytic capacitor on the output pin is recommended when large transient currents are expected on the output to reduce the undershoot, which caused by the inductance of the output power bus just after a short has occurred and the TPS2559-Q1 has abruptly reduced OUT current. Energy stored in the inductance will drive the OUT voltage down and potentially negative as it discharges.

#### 10.2.2.3 Programming the Current-Limit Threshold

The overcurrent threshold is user programmable via an external resistor. The TPS2559-Q1 uses an internal regulation loop to provide a regulated voltage on the ILIM pin. The current-limit threshold is proportional to the current sourced out of ILIM. The recommended 1% resistor range for  $R_{(ILIM)}$  is 24.9 k $\Omega \leq R_{(ILIM)} \leq 100$  k $\Omega$  to ensure stability of the internal regulation loop.

When ILIM pin short to GND (single point failure), maximum current limit is less than 8 A over temperature and process variation.

Many applications require that the minimum current limit is above a certain current level or that the maximum current limit is below a certain current level, so it is important to consider the tolerance of the overcurrent threshold when selecting a value for  $R_{(ILIM)}$ . The equations and the graph below can be used to estimate the minimum and maximum variation of the current-limit threshold for a predefined resistor value within  $R_{(ILIM)}$  is 24.9  $k\Omega \le R_{(ILIM)} \le 100 \ k\Omega$ . This variation is an approximation only and does not take into account, for example, the resistor tolerance. For examples of more-precise variation of  $I_{OS}$  refer to the current-limit section of the *Electrical Characteristics* table.

$$\begin{split} I_{OSmax}(mA) &= \frac{118848 \ V}{R_{(ILIM)}^{0.9918} k\Omega} + 30 \\ I_{OSnom}(mA) &= \frac{118079 \ V}{R_{(ILIM)}^{1.0008} k\Omega} \\ I_{OSmin}(mA) &= \frac{113325 \ V}{R_{(ILIM)}^{1.0010} k\Omega} - 47 \end{split}$$

(1)

 $24.9 \text{ k}\Omega \leq R_{\text{(ILIM)}} \leq 100 \text{ k}\Omega$ 

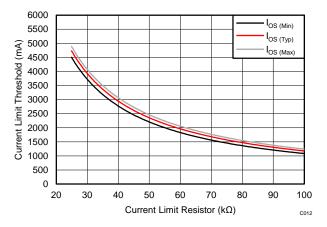

Figure 17. Current-Limit vs R<sub>(ILIM)</sub>

### 10.2.2.4 Design Above a Minimum Current Limit

Some applications require that current limiting cannot occur below a certain threshold. For this example, assume that 3 A must be delivered to the load so that the minimum desired current-limit threshold is 3000 mA. Use the  $I_{OS}$  equations and Figure 17 to select  $R_{(ILIM)}$ .

$$I_{OSmin}(mA) = 3000 mA$$

$$I_{OSmin}(mA) = \frac{113325 \text{ V}}{R_{(ILIM)}^{1.0010} k\Omega} - 47$$

$$R_{\text{(ILIM)}}(k\Omega) = \left(\frac{113325}{I_{\text{OS(min)}} + 47}\right)^{\frac{1}{1.0010}} = \left(\frac{113325}{3000 + 47}\right)^{\frac{1}{1.0010}} = 37.06 \text{ k}\Omega$$
(2)

Select the closest 1% resistor less than the calculated value:  $R_{(ILIM)} = 36.5 \text{ k}\Omega$ . This sets the minimum current-limit threshold at 3016 A.

$$I_{OSmin}(mA) = \frac{113325 \text{ V}}{R_{(ILIM)}^{1.0010} k\Omega} - 47 = \frac{113325}{\left(36.5 \times 1.01\right)^{1.0010}} - 47 = 3016 \text{ mA}$$
(3)

Use the  $I_{OS}$  equations, Figure 17, and the previously calculated value for  $R_{(ILIM)}$  to calculate the maximum resulting current-limit threshold.

$$I_{OSmax}(mA) = \frac{118848}{R_{(ILIM)}^{0.9918}} + 30 = \frac{118848}{(36.5 \times 0.99)^{0.9918}} + 30 = 3417 \text{ mA}$$
(4)

The resulting maximum current-limit threshold minimum is 3016 mA and maximum is 3417 mA with a 36.5 k $\Omega$  ± 1%

#### 10.2.2.5 Design Below a Maximum Current Limit

Some applications require that current limiting must occur below a certain threshold. For this example, assume that 5A must be delivered to the load so that the minimum desired current-limit threshold is 5000 mA. Use the  $I_{OS}$  equations and Figure 17 to select  $R_{(ILIM)}$ .

$$I_{OSmax}(mA) = 5000 \text{ mA}$$

$$I_{OSmax}(mA) = \frac{118848}{R_{(ILIM)}^{0.9918} k\Omega} + 30$$

$$R_{\text{(ILIM)}}(k\Omega) = \left(\frac{118848}{I_{\text{OS(max)}} - 30}\right)^{\frac{1}{0.9918}} = \left(\frac{118848}{5000 - 30}\right)^{\frac{1}{0.9918}} = 24.55 \text{ k}\Omega$$
(5)

Submit Documentation Feedback

www.ti.com SLVSD03 – DECEMBER 2015

Select the closest 1% resistor less than the calculated value:  $R_{ILIM}$  = 24.9 k $\Omega$ . This sets the maximum current-limit threshold at 4950 A.

$$I_{OSmax}(mA) = \frac{118848}{R_{(ILIM)}^{0.9918}k\Omega} + 30 = \frac{118848}{(24.9 \times 0.99)^{0.9918}} + 30 = 4980 \text{ mA}$$
(6)

Use the  $I_{OS}$  equations, Figure 17, and the previously calculated value for  $R_{(ILIM)}$  to calculate the minimum resulting current-limit threshold.

$$I_{OSmin}(mA) = \frac{113325}{R_{(ILIM)}^{1.0010}} - 47 = \frac{113325}{(24.9 \times 1.01)^{1.0010}} - 47 = 4445 \text{ mA}$$
(7)

The resulting minimum current-limit threshold minimum is 4445 mA and maximum is 4980 mA with a 24.9 k $\Omega$  ± 1%.

#### 10.2.2.6 Accounting for Resistor Tolerance

The previous sections described the selection of  $R_{(ILIM)}$  given certain application requirements and the importance of understanding the current-limit threshold tolerance. The analysis focused only on the TPS2559-Q1 is bounded by an upper and lower tolerance centered on a nominal resistance. The additional  $R_{ILIM}$  resistance tolerance directly affects the current-limit threshold accuracy at a system level. Table 1 shows a process that accounts for worst-case resistor tolerance assuming 1% resistor values.

Step one follows the selection process outlined in the application examples above.

Step two determines the upper and lower resistance bounds of the selected resistor.

Step three uses the upper and lower resistor bounds in the IOS equations to calculate the threshold limits.

It is important to use tighter tolerance resistors, that is, 0.5% or 0.1%, when precision current limiting is desired.

Table 1. Common R<sub>(ILIM)</sub> Resistor Selections

DESIRED NOMINAL	IDEAL	CLOSEST 1%	RESISTOR	TOLERANCE	ACTUAL LIMITS			
CURRENT LIMIT (mA)	RESISTOR (kΩ)	RESISTOR (kΩ)	1% LOW (kΩ)	1% HIGH (kΩ)	I <sub>OS</sub> MIN (mA)	I <sub>OS</sub> NOM (mA)	I <sub>OS</sub> MAX (mA)

# TEXAS INSTRUMENTS

#### 10.2.2.7 Power Dissipation and Junction Temperature

The low on-resistance of the N-channel MOSFET allows small surface-mount packages to pass large currents. It is good design practice to estimate power dissipation and junction temperature. The below analysis gives an approximation for calculating junction temperature based on the power dissipation in the package. However, it is important to note that thermal analysis is strongly dependent on additional system level factors. Such factors include air flow, board layout, copper thickness and surface area, and proximity to other devices dissipating power. Good thermal design practice must include all system level factors in addition to individual component analysis. Begin by determining the  $r_{DS(on)}$  of the N-channel MOSFET relative to the input voltage and operating temperature. As an initial estimate, use the highest operating ambient temperature of interest and read  $r_{DS(on)}$  from the typical characteristics graph. Using this value, the power dissipation can be calculated using Equation 8:

$$P_{D} = r_{DS(on)} \times I_{OUT}^{2}$$
(8)

Where:

 $P_D$  = Total power dissipation (W)

 $r_{DS(on)}$  = Power switch on-resistance ( $\Omega$ )

I<sub>OUT</sub> = Maximum current-limit threshold (A)

This step calculates the total power dissipation of the N-channel MOSFET.

Finally, calculate the junction temperature:

$$T_{J} = P_{D} \times \theta_{JA} + T_{A} \tag{9}$$

Where:

 $T_A = Ambient temperature (°C)$ 

 $\theta_{JA}$  = Thermal resistance (°C/W)

P<sub>D</sub> = Total power dissipation (W)

Compare the calculated junction temperature with the initial estimate. If they are not within a few degrees, repeat the calculation using the "refined"  $r_{DS(on)}$  from the previous calculation as the new estimate. Two or three iterations are generally sufficient to achieve the desired result. The final junction temperature is highly dependent on thermal resistance  $\theta_{JA}$  and thermal resistance is highly dependent on the individual package and board layout.

#### 10.2.2.8 Auto-Retry

Some applications require that an overcurrent condition disables the part momentarily during a fault condition and re-enables after a pre-set time. This auto-retry functionality can be implemented with an external resistor and capacitor. During a fault condition, FAULT pulls low EN. The part is disabled when EN is pulled below the turn-off threshold, and FAULT goes high impedance allowing  $C_{(RETRY)}$  to begin charging. The part re-enables when the voltage on EN reaches the turn-on threshold. The part will continue to cycle in this manner until the fault condition is removed. The auto-retry cycling time is determined by the resistor/capacitor time constant, TPS2559-Q1 turn on time and FAULT deglitch time (see Figure 28).

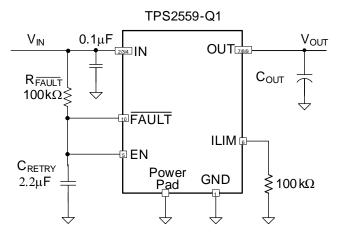

Figure 18. Auto-Retry Circuit

Some applications require auto-retry functionality and the ability to enable/disable with an external logic signal. Figure 19 shows how an external logic signal can drive EN through  $R_{(FAULT)}$  and maintain auto-retry functionality. The resistor/capacitor time constant determines the auto-retry time-out period.

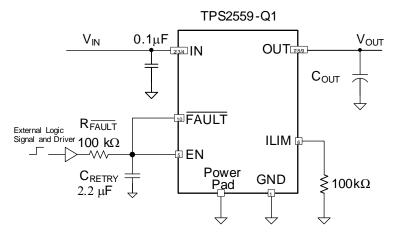

Figure 19. Auto-Retry Circuit with External EN Signal

If need to implement latch-off, refer to application report (SLVA282A).

#### 10.2.2.9 Two-level Current-limit

Some applications require different current-limit thresholds depending on external system conditions. Figure 20 shows an implementation for an externally-controlled, two-level current-limit circuit. The current-limit threshold is set by the total resistance from ILIM to GND (see previously discussed *Programming the Current-Limit Threshold* section). A logic-level input enables/disables MOSFET Q1 and changes the current-limit threshold by modifying the total resistance from ILIM to GND (see Figure 29 and Figure 30). Additional MOSFET/resistor combinations can be used in parallel to Q1/R2 to increase the number of additional current-limit levels.

#### **NOTE**

ILIM should never be driven directly with an external signal.

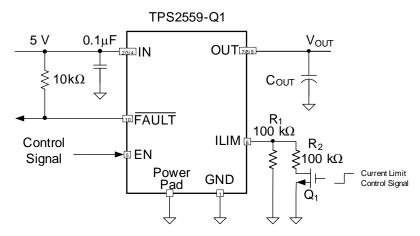

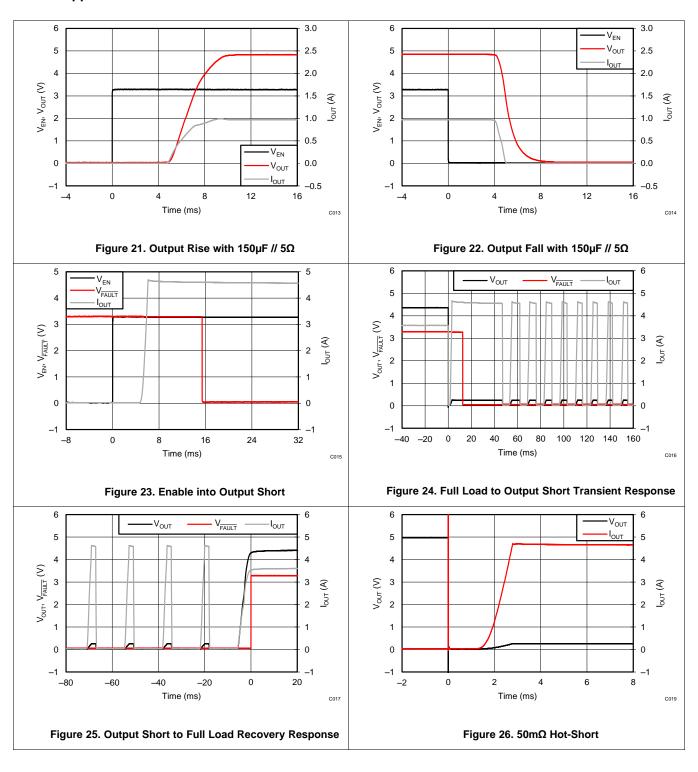

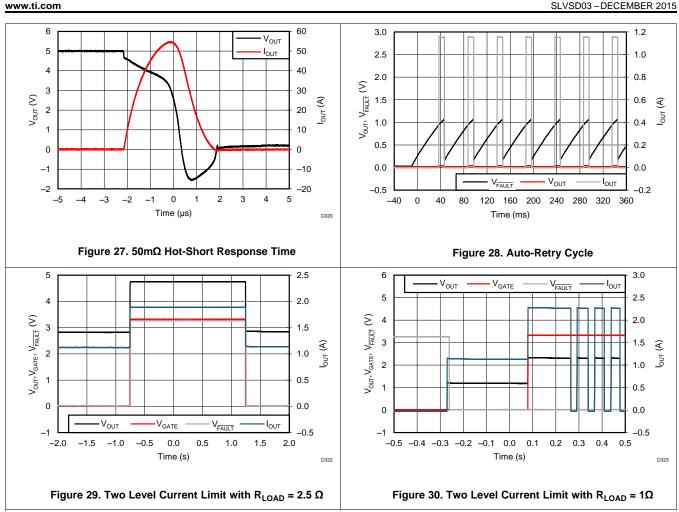

Figure 20. Two-Level Current-Limit Circuit

#### 10.2.3 Application Curves

# **Power Supply Recommendations**

Design of the devices is for operation from an input voltage supply range of 2.5 V to 6.5 V. The current capability of the power supply should exceed the maximum current limit of the power switch.

# 12 Layout

#### 12.1 Layout Guidelines

- Place the 100-nF bypass capacitor near the IN and GND pins, and make the connections using a low-inductance trace.
- Placing a high-value electrolytic capacitor and a 100-nF bypass capacitor on the output pin is recommended when large transient currents are expected on the output.
- The traces routing the R<sub>ILIM</sub> resistor to the device should be as short as possible to reduce parasitic effects on the current limit accuracy.
- The PowerPAD should be directly connected to PCB ground plane using wide and short copper trace.

### 12.2 Layout Example

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Lise

TI E2E™ Online Community TI's Engineer-to-Engineer (E2E) Community. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

#### 13.2 Trademarks

PowerPAD, E2E are trademarks of Texas Instruments. All other trademarks are the property of their respective owners.

# 13.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## 13.4 Glossary

SLYZ022 — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

# 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

# PACKAGE OPTION ADDENDUM

29-Dec-2015

#### PACKAGING INFORMATION

Orderable Device	Status	Package Type	Package Drawing	Pins	Package Qty		Lead/Ball Finish	MSL Peak Temp	Op Temp (°C)	Device Marking	Samples
TPS2559QWDRCRQ1	ACTIVE	VSON	DRC	10	3000	Green (RoHS	(6) CU SN	Level-2-260C-1 YEAR	-40 to 125	(4/5) 2559Q	Samples
						& no Sb/Br)					Samples
TPS2559QWDRCTQ1	ACTIVE	VSON	DRC	10	250	Green (RoHS & no Sb/Br)	CU SN	Level-2-260C-1 YEAR	-40 to 125	2559Q	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

# **PACKAGE OPTION ADDENDUM**

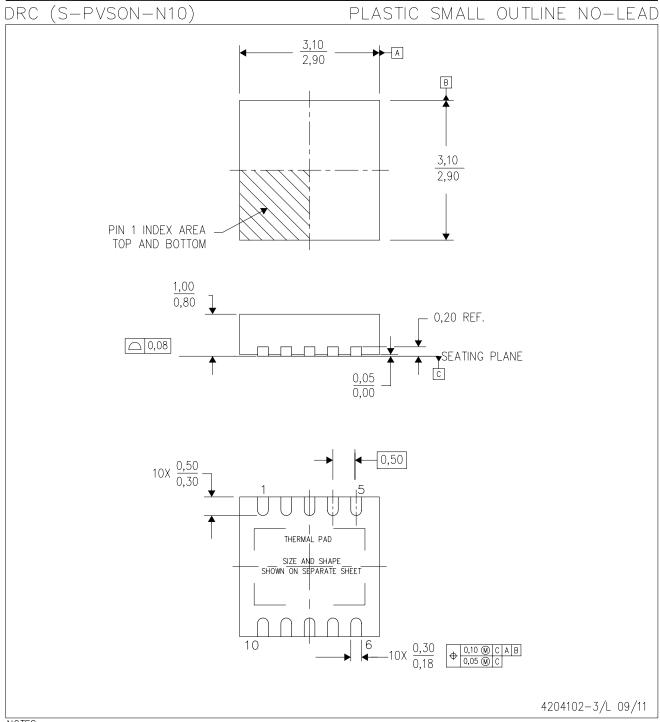

29-Dec-2015

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

#### OTHER QUALIFIED VERSIONS OF TPS2559-Q1:

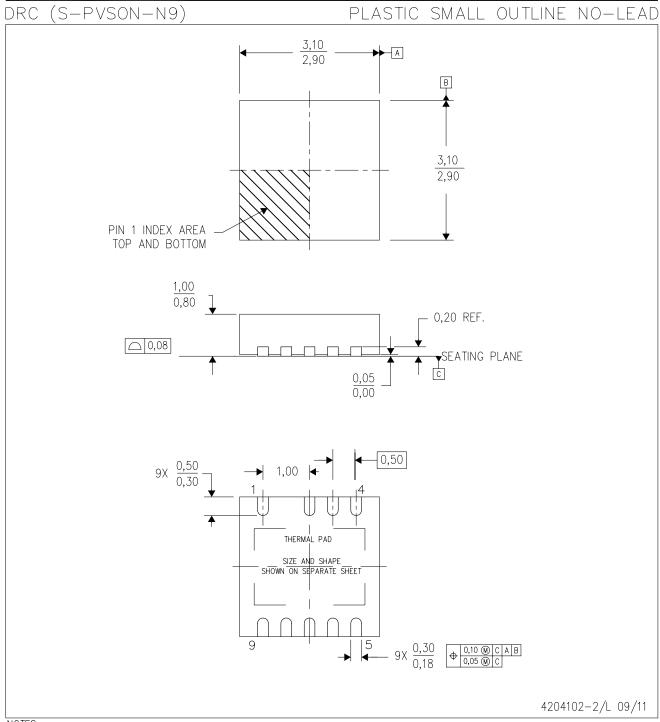

NOTE: Qualified Version Definitions:

• Catalog - TI's standard catalog product

- NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Small Outline No—Lead (SON) package configuration.
  - D. The package thermal pad must be soldered to the board for thermal and mechanical performance, if present.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions, if present

#### IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию.

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России, а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научноисследовательскими институтами России.

С нами вы становитесь еще успешнее!
