

# PCA8547

## 4 x 44 automotive LCD driver with integrated charge pump

Rev. 1 — 21 January 2014

Product data sheet

## 1. General description

---

The PCA8547 is a fully featured Liquid Crystal Display (LCD)<sup>1</sup> driver, specifically designed for high-contrast Vertical Alignment (VA) LCD with multiplex rates up to 1:4. It generates the drive signals for any static or multiplexed LCD containing up to four backplanes, 44 segments, and up to 176 elements. The PCA8547 features an internal charge pump with internal capacitors for on-chip generation of the LCD driving voltage. To ensure an optimal and stable contrast over the full temperature range, the PCA8547 offers a programmable temperature compensation of the LCD supply voltage. The PCA8547 can be easily connected to a microcontroller by either the two-line I<sup>2</sup>C-bus (PCA8547A) or a three-line bidirectional SPI-bus (PCA8547B).

For a selection of NXP LCD segment drivers, see [Table 43 on page 67](#).

## 2. Features and benefits

---

- AEC Q100 compliant for automotive applications.
- Low-power single-chip LCD controller and driver
- 176 elements allowing to drive:
  - ◆ up to 22 7-segment alphanumeric characters
  - ◆ up to 11 14-segment alphanumeric characters
- Selectable backplane drive configuration: static, 2, or 4 backplane multiplexing
- Software programmable internal charge pump for on-chip LCD voltage generation up to 9 V with internal capacitors
- 400 kHz I<sup>2</sup>C-bus interface (PCA8547A)
- 5 MHz SPI-bus interface (PCA8547B)
- Programmable temperature compensation of  $V_{LCD}$  with both, negative and positive slopes in four temperature regions
- Selectable display bias configuration
- Wide range for digital power supply: from 1.8 V to 5.5 V
- Wide LCD supply range: from 2.5 V for low threshold LCDs and up to 9.0 V for high threshold twisted nematic LCDs
- On-chip RAM for display data storage arranged in two banks
- Display memory bank switching
- Programmable frame frequency in the range of 60 Hz to 300 Hz in steps of 10 Hz; factory calibrated
- Integrated temperature sensor with temperature readout
- On chip calibration of internal oscillator frequency and  $V_{LCD}$

---

1. The definition of the abbreviations and acronyms used in this data sheet can be found in [Section 20](#).

- Manufactured in silicon gate CMOS process
- Two RAM banks provided

### 3. Applications

- Instrument cluster
- Car radio
- Climate control units

### 4. Ordering information

**Table 1. Ordering information**

Type number	Package		
	Name	Description	Version
PCA8547AHT	TQFP64	plastic thin quad flat package; 64 leads; body 10 × 10 × 1.0 mm	SOT357-1
PCA8547BHT	TQFP64	plastic thin quad flat package; 64 leads; body 10 × 10 × 1.0 mm	SOT357-1

#### 4.1 Ordering options

**Table 2. Ordering options**

Product type number	Sales item (12NC)	Orderable part number	IC revision	Delivery form
PCA8547AHT/A	935303763518	PCA8547AHT/AY	1	tape and reel, 13 inch
PCA8547BHT/A	935303764518	PCA8547BHT/AY	1	tape and reel, 13 inch

### 5. Marking

**Table 3. Marking codes**

Type number	Marking code
PCA8547AHT	PCA8547AHT
PCA8547BHT	PCA8547BHT

### 6. Block diagram

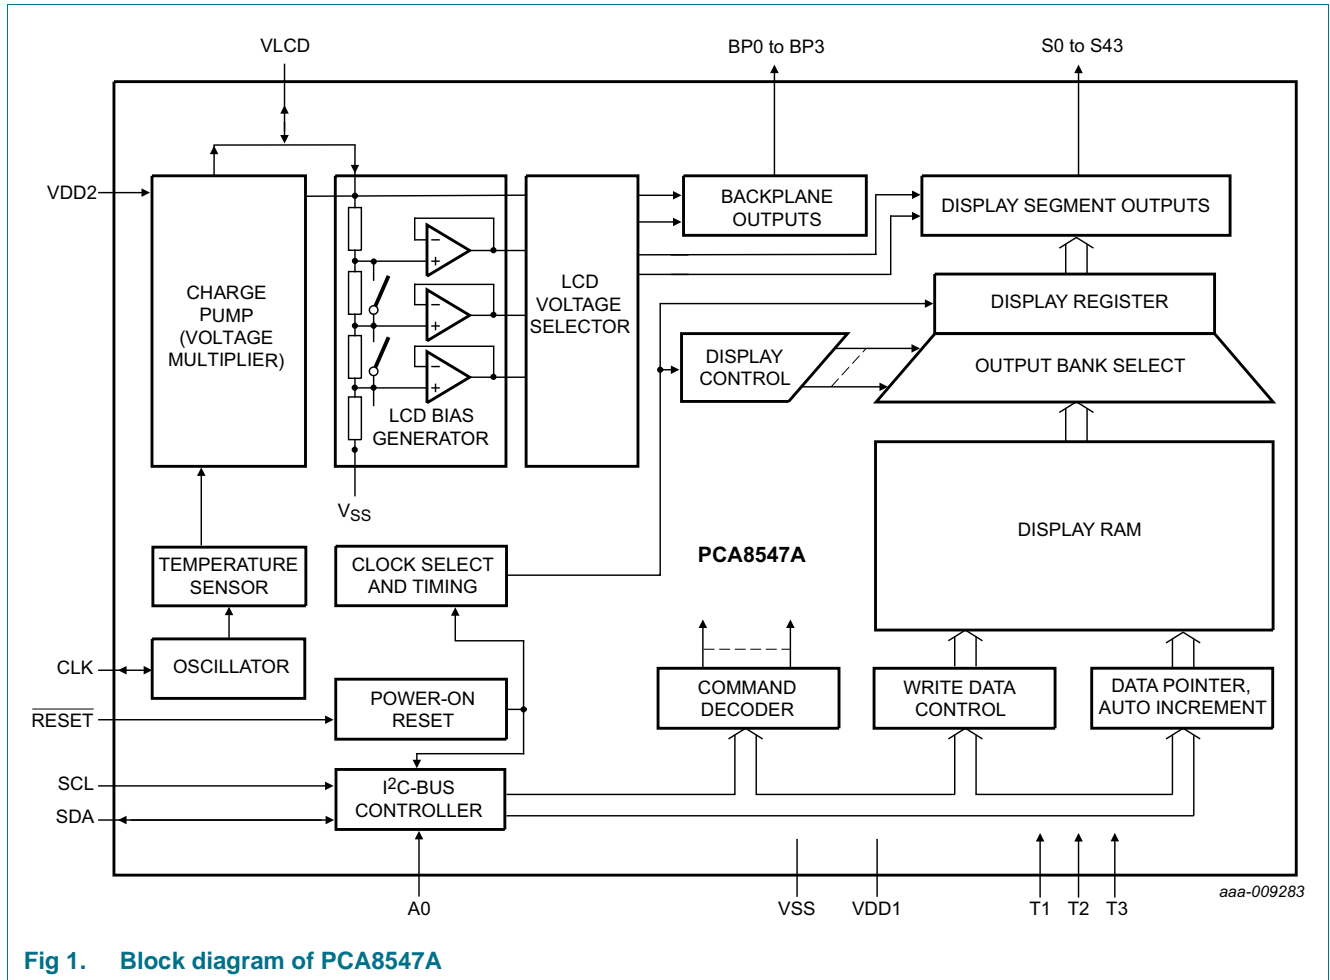

Fig 1. Block diagram of PCA8547A

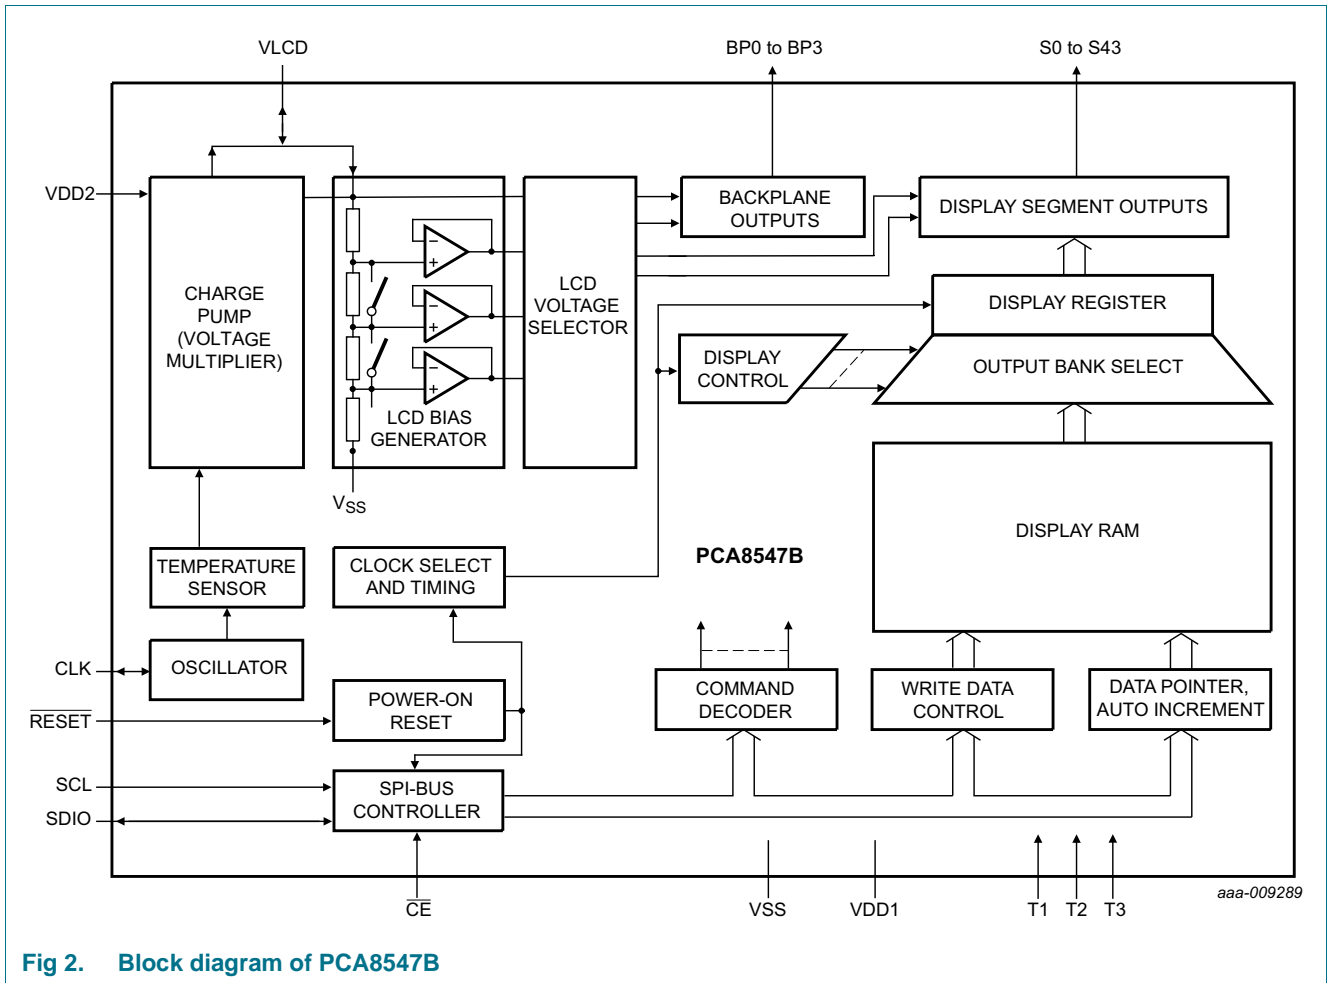

Fig 2. Block diagram of PCA8547B

## 7. Pinning information

### 7.1 Pinning

Top view. For mechanical details, see [Figure 56](#).

**Fig 3. Pin configuration for TQFP64 (PCA8547AHT)**

Top view. For mechanical details, see [Figure 56](#).

**Fig 4. Pin configuration for TQFP64 (PCA8547BHT)**

## 7.2 Pin description

**Table 4. Pin description of PCA8547A and PCA8547B**

Input or input/output pins must always be at a defined level ( $V_{SS}$  or  $V_{DD}$ ) unless otherwise specified.

Pin	Symbol		Type	Description
	PCA8547AHT	PCA8547BHT		
1 to 32	S31 to S0		output	LCD segments
33	$\overline{\text{RESET}}$		input	active low reset input
34	SDA		input/output	I <sup>2</sup> C-bus serial data
		$\overline{\text{CE}}$	input	SPI-bus chip enable - active LOW
35	SCL		input	I <sup>2</sup> C-bus serial clock
		SCL	input	SPI-bus serial clock
36	A0		input	I <sup>2</sup> C-bus slave address selection
		SDIO	input/output	SPI-bus serial data
37, 38, 40	T1 to T3		input	test pins; must be tied to $V_{SS}$ in applications
39	CLK		input/output	internal oscillator output, external oscillator input
41	VSS		supply	ground supply
42	VDD1		supply	supply voltage 1
43	VDD2		supply	supply voltage 2
44	VLCD <sup>[1]</sup>		supply	LCD supply <sup>[2]</sup>
45 to 48	BP0 to BP3		output	LCD backplanes
49 to 52	n.c.		-	not connected; do not connect and do not use as feed through
53 to 64	S43 to S32		output	LCD segments

[1]  $V_{LCD}$  must be equal to or greater than  $V_{DD2}$ .

[2] When the internal  $V_{LCD}$  generation is used, this pin drives the  $V_{LCD}$  voltage. In this case pin VLCD is an output. When the external supply is requested, then pin VLCD is an input and  $V_{LCD}$  can be supplied on it. In this case, the internal charge pump must be disabled (see [Table 9](#)).

## 8. Functional description

The PCA8547 is a versatile peripheral device designed to interface any microcontroller to a wide variety of LCDs. It can directly drive any static or multiplexed LCD containing up to 176 elements.

### 8.1 Commands of PCA8547

The commands to control the PCA8547 are defined in [Table 5](#). Any other combinations of operation code bits that are not mentioned in this document can lead to undesired operation modes of PCA8547.

**Table 5. Commands of PCA8547**

*The bit labeled with - is not implemented.*

Command name	RS <sup>[1]</sup>	Bits								Reference
		7	6	5	4	3	2	1	0	
Initialize										<a href="#">Section 8.1.1</a>
initialize-MSB	0	0	0	1	1	1	0	1	0	
initialize-LSB	0	0	0	0	0	0	1	0	0	
OTP-refresh	0	1	1	0	1	0	0	0	0	<a href="#">Section 8.1.2</a>
Oscillator-ctrl	0	1	1	0	0	1	1	COE	OSC	<a href="#">Section 8.1.3</a>
Charge-pump-ctrl	0	1	1	0	0	0	0	CPE	CPC	<a href="#">Section 8.1.4</a>
Temp-msr-ctrl	0	1	1	0	0	1	0	TCE	TME	<a href="#">Section 8.1.5</a>
Temp-comp	0	0	0	0	1	1	SLA[2:0]			<a href="#">Section 8.1.6</a>
	0	0	0	1	0	0	SLB[2:0]			
	0	0	0	1	0	1	SLC[2:0]			
	0	0	0	1	1	0	SLD[2:0]			
Set-VPR	0	0	1	0	0	VPR[7:4]			<a href="#">Section 8.1.7</a>	
	0	0	1	0	1	VPR[3:0]				
Display-enable	0	0	0	1	1	1	0	0	E	<a href="#">Section 8.1.8</a>
Set-MUX-mode	0	0	0	0	0	0	M[2:0]		<a href="#">Section 8.1.9</a>	
Set-bias-mode	0	1	1	0	0	0	1	B[1:0]		<a href="#">Section 8.1.10</a>
Load-data-pointer	0	1	0	P[5:0]			<a href="#">Section 8.1.11</a>			
Frame-frequency	0	0	1	1	F[4:0]			<a href="#">Section 8.1.12</a>		
Bank-select	0	0	0	0	0	1	0	IBS	OBS	<a href="#">Section 8.1.13</a>
Write-RAM-data	1	B[7:0]								<a href="#">Section 8.1.14</a>
Temp-read	-	TD[7:0]								<a href="#">Section 8.1.15</a>
Invmode_ctrl	0	1	1	0	1	0	1	LF	0	<a href="#">Section 8.1.16</a>
Temp-filter	0	1	1	0	1	0	0	1	TFE	<a href="#">Section 8.1.17</a>

[1] For further information about the register selection bit, see [Table 31 on page 45](#).

### 8.1.1 Command: Initialize

This command generates a chip-wide reset. It consists of two bytes which have to be sent both to the device.

**Table 6. Initialize - initialize command bit description**

For further information, see [Section 8.2 on page 16](#).

Bit	Symbol	Value	Description
<b>Initialize-MSB</b>			
7 to 0	-	00111010	fixed value
<b>Initialize-LSB</b>			
7 to 0	-	00000100	fixed value

### 8.1.2 Command: OTP-refresh

During production and testing of the device, each IC is calibrated to achieve the specified accuracy of  $V_{LCD}$ , the frame frequency, and the temperature measurement. This calibration is performed on EPROM cells called One Time Programmable (OTP) cells.

The device reads these cells every time at power-on, after a reset, and every time when the initialize command or the OTP-refresh command is sent.

**Remark:** It is recommended not to enter power-down mode during the OTP refresh cycle.

**Table 7. OTP-refresh - OTP-refresh command bit description**

Bit	Symbol	Binary value	Description
7 to 0	-	11010000	fixed value

### 8.1.3 Command: Oscillator-ctrl

The Oscillator-ctrl command switches between internal and external oscillator and enables or disables the pin CLK.

**Table 8. Oscillator-ctrl - oscillator control command bit description**

For further information, see [Section 8.1.3.1](#).

Bit	Symbol	Binary value	Description
7 to 2	-	110011	fixed value
1	COE		<b>control pin CLK</b>
		0 <sup>[1]</sup>	clock signal not available on pin CLK; pin CLK is in 3-state and may be left floating
		1	clock signal available on pin CLK
0	OSC		<b>oscillator source</b>
		0 <sup>[1]</sup>	internal oscillator used
		1	external oscillator used; pin CLK becomes an input

[1] Default value.

#### 8.1.3.1 Oscillator

The internal logic and LCD drive signals of the PCA8547 are timed either by the built-in oscillator or from an external clock.

**8.1.3.2 Internal oscillator**

When the internal oscillator is used, it is possible to make the clock signal available on pin CLK by using the Oscillator-ctrl command (see [Table 8](#)). If this is not intended, the pin CLK should be left open. At power-on the signal at pin CLK is disabled and pin CLK is in 3-state.

If the internal charge pump is enabled, then the internal oscillator starts and is used to run the charge pump. An external oscillator can still be applied for driving the display waveforms.

The duty cycle of the output clock provided on the CLK pin is not always 50 : 50. [Table 18 on page 12](#) shows the expected duty cycle for each of the chosen frame frequencies.

**8.1.3.3 External clock**

In applications where an external clock must be applied to the PCA8547, bit OSC (see [Table 8](#)) must be set logic 1. In this case, pin CLK becomes an input.

The CLK signal is a signal that is fed into the V<sub>DD1</sub> domain. Therefore it must have an amplitude equal to the V<sub>DD1</sub> voltage supplied to the chip and be referenced to V<sub>SS</sub>.

The clock frequency (f<sub>clk</sub>) determines the LCD frame frequency.

**Remark:** If an external clock is used then this clock signal must always be supplied to the device. Removing the clock can freeze the LCD in a DC state. Removal of the clock is possible when following the correct procedures (see [Figure 11 on page 21](#) and [Figure 12 on page 22](#)).

**8.1.4 Command: Charge-pump-ctrl**

The Charge-pump-ctrl command enables or disables the internal V<sub>LCD</sub> generation and controls the charge pump voltage multiplier setting.

**Table 9. Charge-pump-ctrl - charge pump control command bit description**  
For further information, see [Table 12 on page 11](#) and [Section 8.4.3 on page 26](#).

Bit	Symbol	Binary value	Description
7 to 2	-	110000	fixed value
1	CPE		<b>charge pump switch</b>
		0 <sup>[1]</sup>	charge pump disabled; no internal V <sub>LCD</sub> generation; external supply of V <sub>LCD</sub>
		1	charge pump enabled
0	CPC		<b>charge pump voltage multiplier setting</b>
		0 <sup>[1]</sup>	V <sub>LCD</sub> = 2 × V <sub>DD2</sub>
		1	V <sub>LCD</sub> = 3 × V <sub>DD2</sub>

[1] Default value.

### 8.1.5 Command: Temp-msr-ctrl

The Temp-msr-ctrl command enables or disables the temperature measurement block and the temperature compensation of  $V_{LCD}$ .

**Table 10. Temp-msr-ctrl - temperature measurement control command bit description**

For further information, see [Section 8.4.4 on page 28](#).

Bit	Symbol	Binary value	Description
7 to 2	-	110010	fixed value
1	TCE		<b>temperature compensation switch</b>
		0	no temperature compensation of $V_{LCD}$ possible
		1 <sup>[1]</sup>	temperature compensation of $V_{LCD}$ possible
0	TME		<b>temperature measurement switch</b>
		0	temperature measurement disabled: no temperature readout possible
		1 <sup>[1]</sup>	temperature measurement enabled: temperature readout possible

[1] Default value.

### 8.1.6 Command: Temp-comp

The Temp-comp command allows setting the temperature compensation coefficients for each of the temperature regions SFA to SFD. For further information, see [Section 8.4.4.2](#).

**Table 11. Temp-comp - temperature compensation coefficients command**

For further information, see [Section 8.4.4 on page 28](#).

Bit	Symbol	Binary value	Description
<b>SLA</b>			
7 to 3	-	00011	fixed value
2 to 0	SLA[2:0]	000 <sup>[1]</sup> to 111	<b>temperature compensation coefficient SLA</b> , see <a href="#">Table 27 on page 30</a>
<b>SLB</b>			
7 to 3	-	00100	fixed value
2 to 0	SLB[2:0]	000 <sup>[1]</sup> to 111	<b>temperature compensation coefficient SLB</b> , see <a href="#">Table 27 on page 30</a>
<b>SLC</b>			
7 to 3	-	00101	fixed value
2 to 0	SLC[2:0]	000 <sup>[1]</sup> to 111	<b>temperature compensation coefficient SLC</b> , see <a href="#">Table 27 on page 30</a>
<b>SLD</b>			
7 to 3	-	00110	fixed value
2 to 0	SLD[2:0]	000 <sup>[1]</sup> to 111	<b>temperature compensation coefficient SLD</b> , see <a href="#">Table 27 on page 30</a>

[1] Default value.

### 8.1.7 Command: Set-VPR

With these two instructions, it is possible to set the target  $V_{LCD}$  voltage for the internal charge pump.

**Table 12. Set-VPR - set VPR command bit description**

For further information, see [Section 8.4.2 on page 25](#).

Bit	Symbol	Binary value	Description
<b>Set-VPR MSB</b>			
7 to 4	-	0100	fixed value
3 to 0	VPR[7:4]	0000 <sup>[1]</sup> to 1111 <sup>[2]</sup>	<b>the four most significant bits of VPR[7:0]</b>
<b>Set-VPR LSB</b>			
7 to 4	-	0101	fixed value
3 to 0	VPR[3:0]	0000 <sup>[1]</sup> to 1111 <sup>[2]</sup>	<b>the four least significant bits of VPR[7:0]</b>

[1] Default value.

[2] VPR[7:0] = 0h results in  $V_{prog(LCD)} = 3\text{ V}$ ;  
VPR[7:0] = C8h results in  $V_{prog(LCD)} = 9\text{ V}$ .

### 8.1.8 Command: Display-enable

This command allows switching the display on and off. The possibility to disable and enable the display allows implementation of blinking the entire display under external control.

**Table 13. Display-enable - display enable command bit description**

Bit	Symbol	Binary value	Description
7 to 1	-	0011100	fixed value
0	E	0 <sup>[1]</sup>	<b>display disabled</b> backplane and segment outputs are internally connected to $V_{SS}$
		1	<b>display enabled</b>

[1] Default value.

### 8.1.9 Command: Set-MUX-mode

The multiplex drive mode is configured with the bits described in [Table 14](#).

**Table 14. Set-MUX-mode - set multiplex drive mode command bit description**

For further information, see [Section 8.4.5 on page 31](#).

Bit	Symbol	Binary value	Description
7 to 3	-	00000	fixed value
2 to 0	M[2:0]	100 <sup>[1]</sup>	<b>1:4 multiplex drive mode</b> 4 backplanes and 44 segments
		010	<b>1:2 multiplex drive mode</b> 2 backplanes and 44 segments
		001	<b>static drive mode</b> 1 backplane and 44 segments

[1] Default value.

### 8.1.10 Command: Set-bias-mode

The Set-bias-mode command allows setting the bias level.

**Table 15. Set-bias-mode - set bias mode command bit description**

For further information, see [Section 8.4.5 on page 31](#).

Bit	Symbol	Binary value	Description
7 to 2	-	110001	fixed value
1 to 0	B[1:0]		<b>LCD bias configuration</b> <sup>[1]</sup>
		00 <sup>[2]</sup>	1/4 bias
		01	
		11	1/3 bias
		10	1/2 bias

[1] Not applicable for static drive mode.

[2] Default value.

### 8.1.11 Command: Load-data-pointer

The Load-data-pointer command defines the display RAM address where the following display data will be sent to.

**Table 16. Load-data-pointer - load data pointer command bit description**

For further information, see [Section 8.8 on page 39](#).

Bit	Symbol	Binary value	Description
7 to 6	-	10	fixed value
5 to 0	P[5:0]	000000 to 101101	<b>RAM address</b> 6-bit binary value of 0 to 45

### 8.1.12 Command: Frame-frequency

With the Frame-frequency command, the frame frequency and the output clock frequency can be configured.

**Table 17. Frame frequency - frame frequency and output clock frequency command bit description**

Bit	Symbol	Binary value	Description
7 to 5	-	011	fixed value
4 to 0	F[4:0]	see <a href="#">Table 18</a>	<b>frame frequency values</b> , see <a href="#">Table 18</a>

**Table 18. Frame frequency values**

F[4:0]	Nominal frame frequency $f_{fr}$ (Hz) <sup>[1]</sup>	Resultant output clock frequency, $f_{clk(o)}$ (Hz)	Duty cycle (%) <sup>[2]</sup>
00000	60	2880	20 : 80
00001	70	3360	7 : 93
00010	80	3840	47 : 53
00011	91	4368	40 : 60
00100	100	4800	33 : 67
00101	109	5232	27 : 73
00110	120	5760	20 : 80

Table 18. Frame frequency values ...continued

F[4:0]	Nominal frame frequency $f_{fr}$ (Hz) <sup>[1]</sup>	Resultant output clock frequency, $f_{clk(o)}$ (Hz)	Duty cycle (%) <sup>[2]</sup>
00111	129.7	6226	13 : 87
01000	141.2	6778	5 : 95
01001	150	7200	50 : 50
01010	160	7680	47 : 53
01011	171.4	8227	43 : 57
01100	177.8	8534	41 : 59
01101	192	9216	36 : 64
01110 <sup>[3]</sup>	200	9600	33 : 67
01111	208.7	10018	30 : 70
10000	218.2	10474	27 : 73
10001	228.6	10973	23 : 77
10010	240	11520	20 : 80
10011	252.6	12125	16 : 84
10100, 10101	266.7	12802	10 : 90
10110, 10111	282.4	13555	5 : 95
11000 to 11111	300	14400	50 : 50

[1] Nominal frame frequency calculated for the default clock frequency of 9600 Hz.

[2] Duty cycle definition: % HIGH-level time : % LOW-level time.

[3] Default value.

### 8.1.12.1 Timing and frame frequency

The timing of the PCA8547 organizes the internal data flow of the device. This includes the transfer of display data from the display RAM to the display segment outputs. The timing also generates the LCD frame frequency. The frame frequency is a fixed division of the internal clock or of the frequency applied to pin CLK when an external clock is used.

When the internal clock is used, the clock frequency can be programmed by software such that the nominal frame frequency can be chosen in steps of 10 Hz in the range of 60 Hz to 300 Hz (see [Table 18](#)). Furthermore the nominal frame frequency is factory-calibrated with an accuracy of  $\pm 15\%$ .

When the internal clock is enabled at pin CLK by using bit COE, the duty ratio of the clock may change when choosing different values for the frame frequency prescaler. [Table 18](#) shows the different output duty ratios for each frame frequency prescaler setting.

### 8.1.13 Command: Bank-select

The PCA8547 allows writing data to one area of the RAM while displaying from another. These areas are named RAM banks. There are two banks, 0 and 1. [Figure 33 on page 43](#) and [Figure 34 on page 43](#) show the concept. The Bank-select command controls where data is written to and where it is displayed from.

**Table 19. Bank-select - bank select command bit description**For further information, see [Section 8.9 on page 43](#).

Bit	Symbol	Binary value	Description
7 to 2	-	000010	fixed value
1	IBS		<b>selects RAM bank to write to</b>
		0 <sup>[1]</sup>	Bank 0
		1	Bank 1
0	OBS		<b>selects RAM bank to read from to the LCD</b>
		0 <sup>[1]</sup>	Bank 0
		1	Bank 1

[1] Default value.

### 8.1.14 Command: Write-RAM-data

By setting the RS bit of the control byte to logic 1, all data transferred is interpreted as RAM data and placed in the RAM in accordance with the current setting of the RAM address pointer (see [Section 8.1.11 on page 12](#)). Definition of the RS can be found in [Table 31 on page 45](#).

**Remark:** After Power-On Reset (POR) the RAM content is random and should be brought to a defined status by clearing it (setting it to logic 0).

**Table 20. Write-RAM-data - write RAM data command bit description**For further information, see [Section 8.8 on page 39](#).

Bit	Symbol	Binary value	Description
7 to 0	B[7:0]	00000000 to 11111111	<b>writing data byte-wise to the RAM</b>

### 8.1.15 Command: Temp-read

The Temp-read command allows reading out the temperature values measured by the internal temperature sensor.

**Table 21. Temp-read - temperature readout command bit description**For further information, see [Section 8.4.4 on page 28](#).

Bit	Symbol	Binary value	Description
7 to 0	TD[7:0]	00000000 to 11111111	<b>digital temperature values<sup>[1]</sup></b>

[1] For this command, bit  $\overline{R/W}$  of the I<sup>2</sup>C-bus slave address byte has to be set logic 1 (see [Table 32](#)).

### 8.1.16 Command: Invmode\_ctrl

The Invmode\_ctrl command allows changing the drive scheme inversion mode.

The waveforms used to drive LCD displays inherently produce a DC voltage across the display cell. The PCA8547 compensates for the DC voltage by inverting the waveforms on alternate frames or alternate lines. The choice of compensation method is determined with the LF bit.

**Table 22. Invmode\_ctrl - drive scheme inversion command bit description**

For further information, see [Section 8.4.6 on page 34](#).

Bit	Symbol	Binary value	Description
7 to 2	-	110101	fixed value
1	LF		<b>set inversion mode</b>
		0 <sup>[1]</sup>	driving scheme A: line inversion mode
		1	driving scheme B: frame inversion mode
0	-	0	fixed value

[1] Default value.

In frame inversion mode, the DC value is compensated across two frames and not within one frame. Changing the inversion mode to frame inversion reduces the power consumption, therefore it is useful when power consumption is a key point in the application.

Frame inversion may not be suitable for all applications. The RMS voltage across a segment is better defined, however since the switching frequency is reduced there is possibility for flicker to occur.

[Figure 24 on page 34](#) to [Figure 27 on page 37](#) are showing the waveforms in line inversion mode.

### 8.1.17 Command: Temp-filter

**Table 23. Temp-filter - digital temperature filter command bit description**

For further information, see [Section 8.4.4 on page 28](#).

Bit	Symbol	Binary value	Description
7 to 1	-	1101001	fixed value
0	TFE		<b>digital temperature filter switch</b>
		0 <sup>[1]</sup>	digital temperature filter disabled; the unfiltered digital value of TD[7:0] is immediately available for the readout and V <sub>LCD</sub> compensation, see <a href="#">Section 8.4.4.1</a>
		1	digital temperature filter enabled

[1] Default value.

## 8.2 Start-up and shut-down

### 8.2.1 Reset and Power-On Reset (POR)

After power-on the PCA8547 has to be initialized by sending the two bytes of the initialize command (see [Section 8.1.1](#) and [Table 6](#)).

After a reset and the initialization the starting conditions of the PCA8547 are as follows:

1. All backplane and segment outputs are set to  $V_{SS}$ .
2. Selected drive mode is: 1:4 with  $\frac{1}{4}$  bias.
3. Input and output bank selectors are reset.
4. The I<sup>2</sup>C-bus and SPI-bus interface are initialized.
5. The data pointer is cleared (set logic 0).
6. The internal oscillator is running; no clock signal is available on pin CLK; pin CLK is in 3-state.
7. Temperature measurement is enabled.
8. Temperature filter is disabled.
9. The internal  $V_{LCD}$  voltage generation is disabled. The charge pump is switched off.
10. The  $V_{LCD}$  temperature compensation is enabled.
11. The display is disabled.

The state after a reset and the initialization is shown in [Table 24](#).

**Table 24. Starting conditions**

Starting conditions of configuration bits shown in the command table format for clarity. The bit labeled with - has an undefined reset state.

Command name	Bits							
	7	6	5	4	3	2	1	0
Oscillator-ctrl	1	1	0	0	1	1	COE = 0	OSC = 0
Charge-pump-ctrl	1	1	0	0	0	0	CPE = 0	CPC = 0
Temp-msr-ctrl	1	1	0	0	1	0	TCE = 1	TME = 1
Temp-comp	0	0	0	1	1	SLA[2:0] = 000		
	0	0	1	0	0	SLB[2:0] = 000		
	0	0	1	0	1	SLC[2:0] = 000		
	0	0	1	1	0	SLD[2:0] = 000		
Set-VPR	0	1	0	0	VPR[7:4] = 0000			
	0	1	0	1	VPR[3:0] = 0000			
Display-enable	0	0	1	1	1	0	0	E = 0
Set-MUX-mode	0	0	0	0	0	M[2:0] = 100		
Set-bias-mode	1	1	0	0	0	1	B[1:0] = 00	
Load-data-pointer	1	0	P[5:0] is undefined					
Frame-frequency	0	1	1	F[4:0] = 01110				
Bank-select	0	0	0	0	1	0	IBS = 0	OBS = 0
Invmode_ctrl	1	1	0	1	0	1	LF = 0	-
Temp-filter	1	1	0	1	0	0	1	TFE = 0

**Remark:** Do not transfer data on the I<sup>2</sup>C-bus or SPI-bus for at least 1 ms after a power-on reset to allow the reset action to complete.

The first command sent to the device after the power-on or reset event must be the Initialize command (see [Section 8.1.1](#)).

After POR and before enabling the display, the RAM content should be brought to a defined status

- by clearing it (setting it all to logic 0) or
- by writing meaningful content (for example, a graphic)

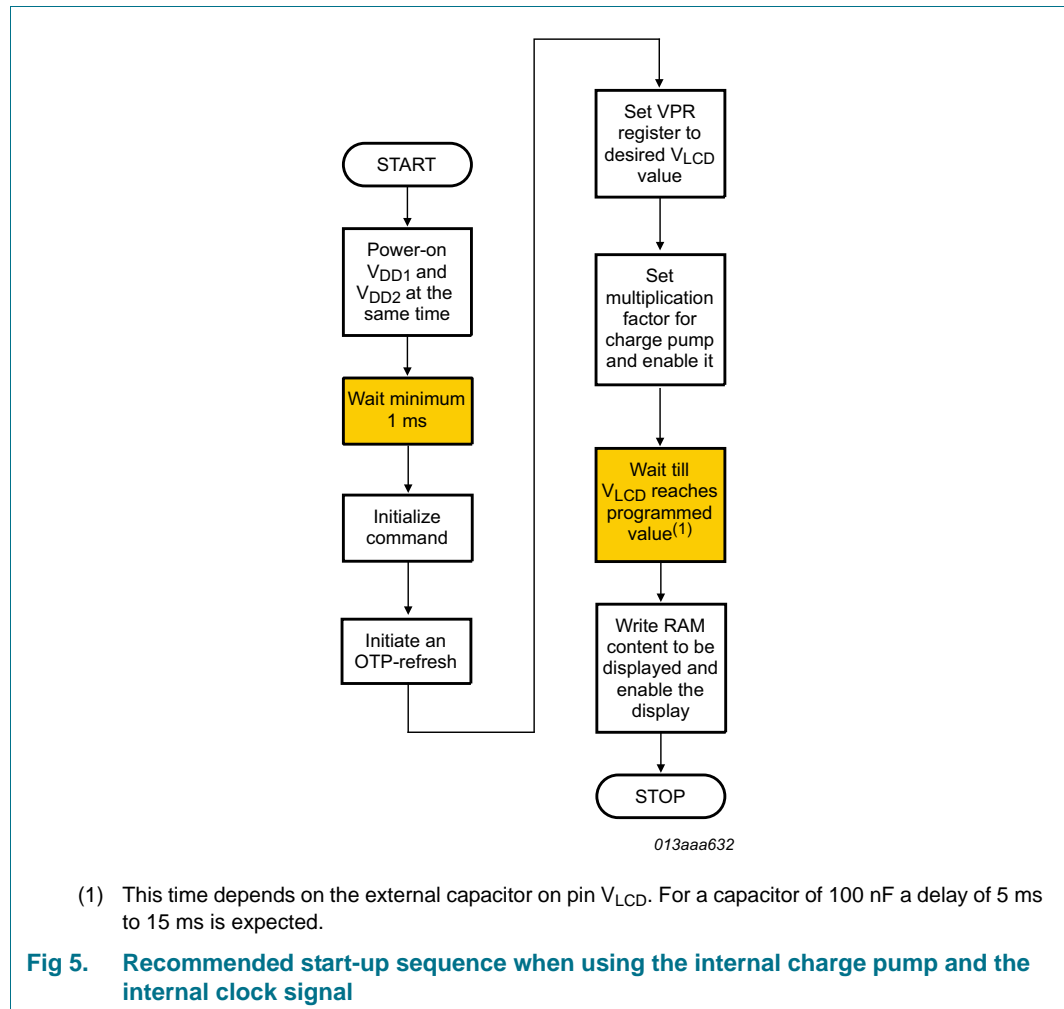

otherwise unwanted display artifacts may appear on the display.

### 8.2.2 RESET pin function

The RESET pin sets the PCA8547 in a defined state. The RAM contents remain unchanged. After the reset signal is removed, the initialize command (see [Section 8.1.1](#) and [Table 6](#)) has to be sent to the PCA8547. See [Section 8.2.1](#) for details.

### 8.2.3 Recommended start-up sequences

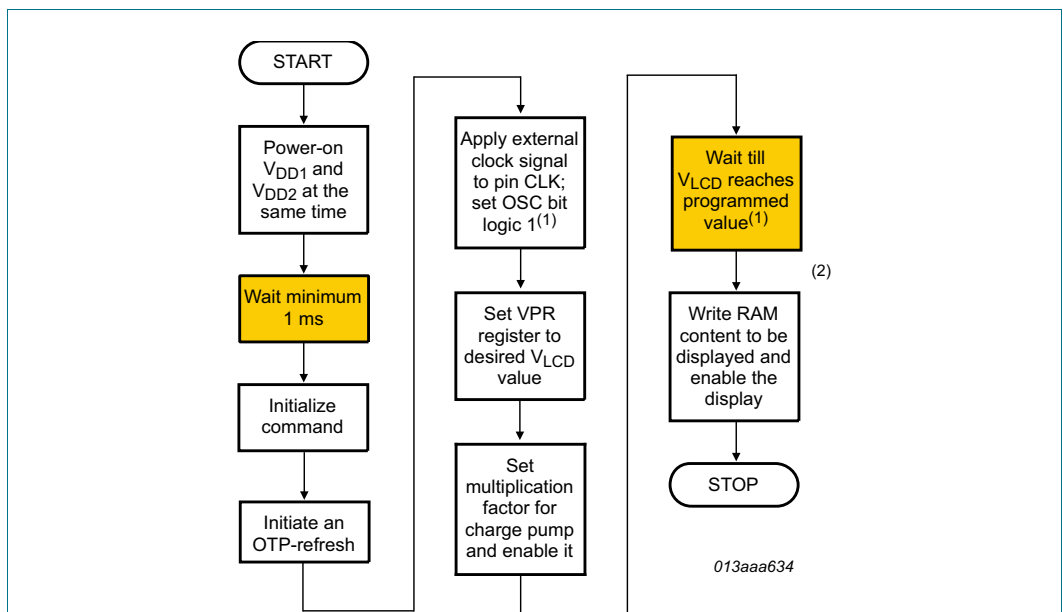

This chapter describes how to proceed with the initialization of the chip in different application modes.

If the display is enabled too soon after the charge pump is enabled, then the  $V_{LCD}$  voltage may not have yet stabilized leading to an uneven display effect.

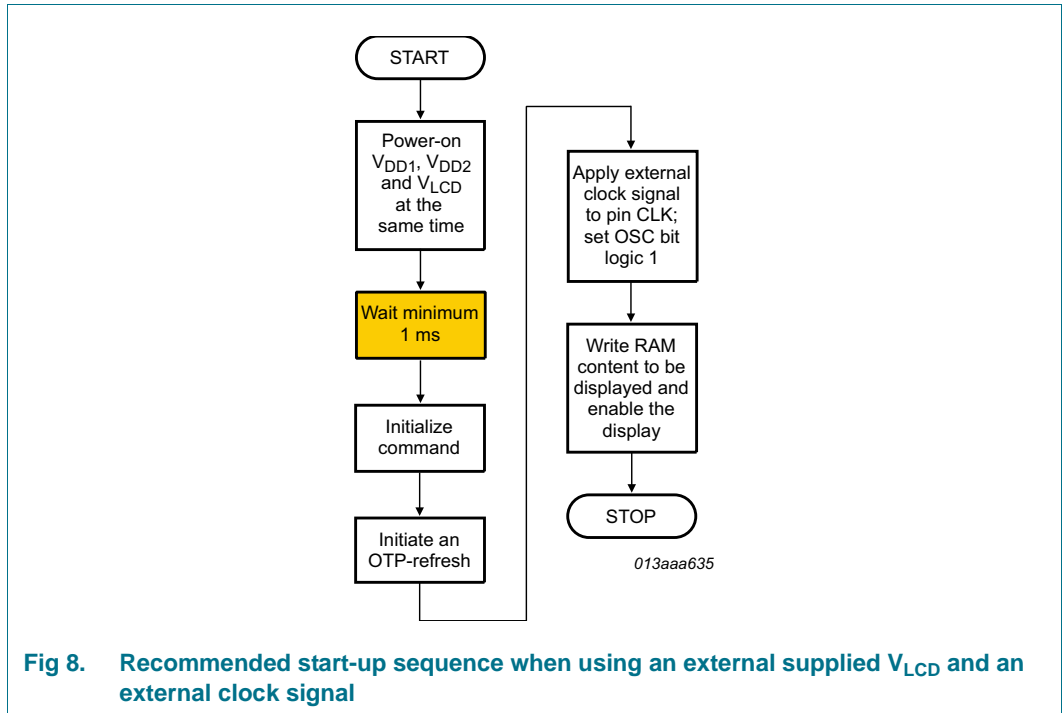

**Fig 6. Recommended start-up sequence when using an external supplied  $V_{LCD}$  and the internal clock signal**

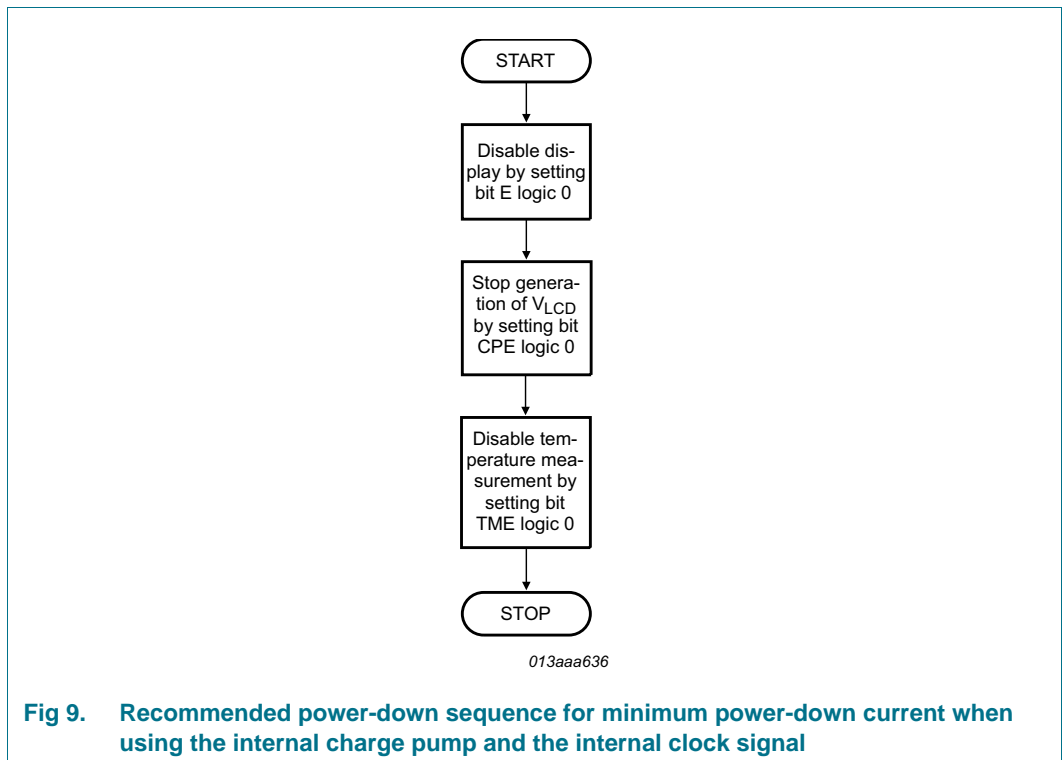

- (1) The external clock signal can be applied after the generation of the  $V_{LCD}$  voltage as well.
- (2) This time depends on the external capacitor on pin  $V_{LCD}$ . For a capacitor of 100 nF a delay of 5 ms to 15 ms is expected.

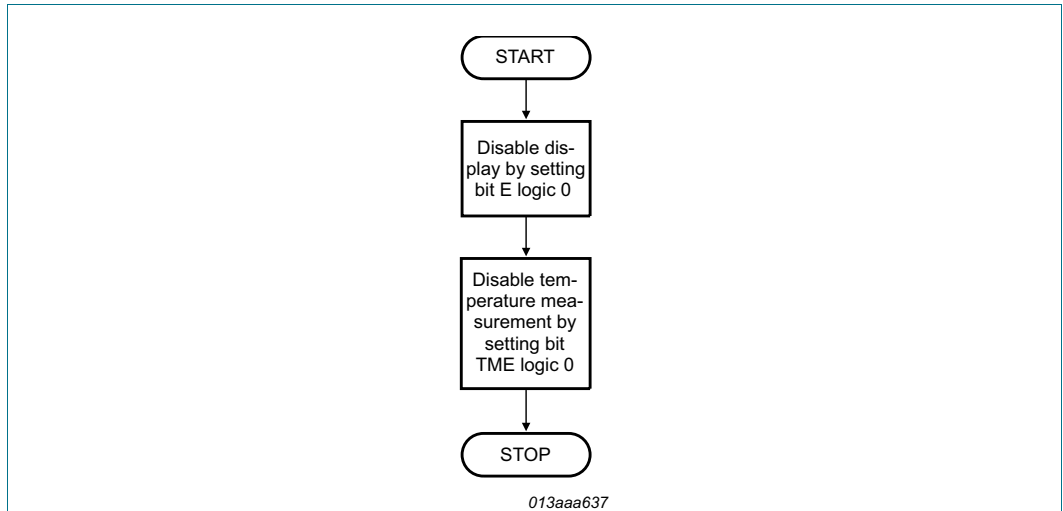

**Fig 7. Recommended start-up sequence when using the internal charge pump and an external clock signal**

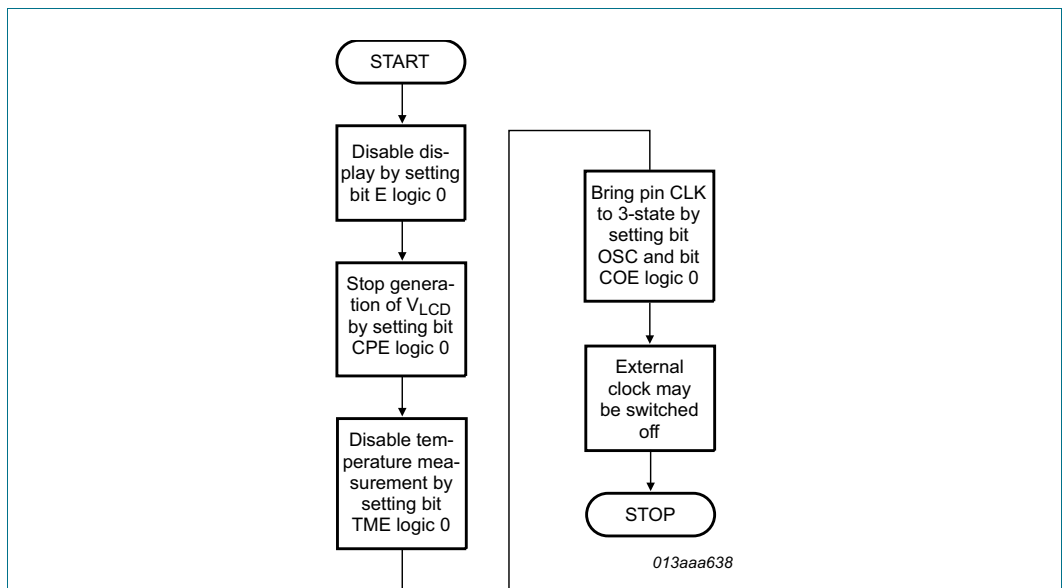

**8.2.4 Recommended sequences to enter power-down mode**

With the following sequences, the PCA8547 can be set to a state of minimum power consumption, called power-down mode.

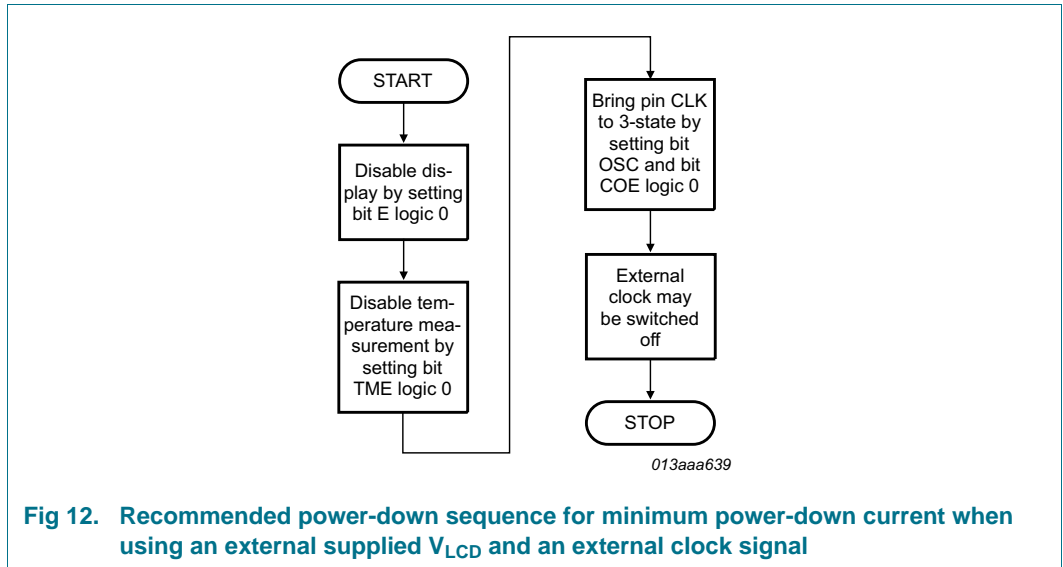

**Fig 10. Recommended power-down sequence when using an external supplied  $V_{LCD}$  and the internal clock signal**

**Fig 11. Recommended power-down sequence when using the internal charge pump and an external clock signal**

**Remark:** It is necessary to run the power-down sequence before removing the supplies. Depending on the application, care must be taken that no other signals are present at the chip input or output pins when removing the supplies (see [Section 10](#)). Otherwise this may cause unwanted display artifacts. In the case of uncontrolled removal of supply voltages the PCA8547 will not be damaged.

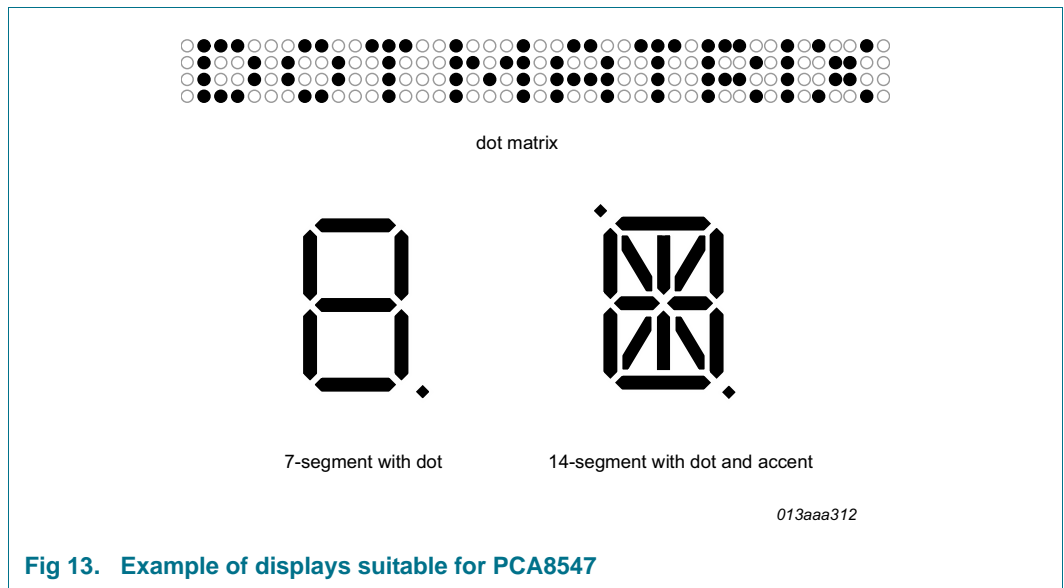

**Remark:** Static voltages across the liquid crystal display can build up when the external LCD supply voltage ( $V_{LCD}$ ) is on while the IC supply voltage ( $V_{DD1}$  or  $V_{DD2}$ ) is off, or the other way around. This may cause unwanted display artifacts. To avoid such artifacts,  $V_{LCD}$ ,  $V_{DD1}$ , and  $V_{DD2}$  must be applied or removed together.

**Remark:** A clock signal must always be supplied to the device when the display is active. Removing the clock may freeze the LCD in a DC state, which is not suitable for the liquid crystal. It is recommended to first disable the display and afterwards to remove the clock signal.

### 8.3 Possible display configurations

The PCA8547 is a versatile peripheral device designed to interface between any microcontroller to a wide variety of LCD segment or dot matrix displays (see [Figure 13](#)). It can directly drive any static or multiplexed LCD containing up to four backplanes with 44 segments.

The display configurations possible with the PCA8547 depend on the number of active backplane outputs required. A selection of possible display configurations is given in [Table 25](#).

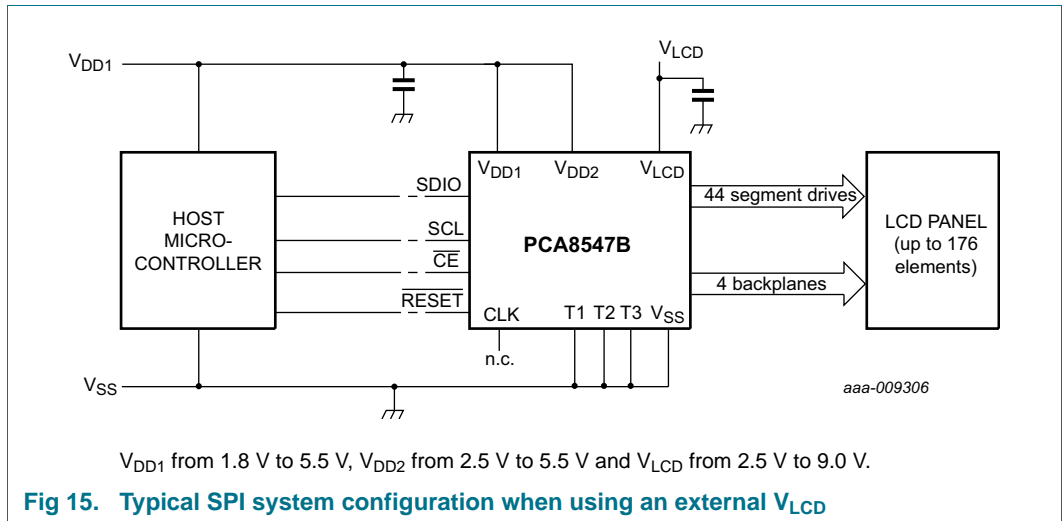

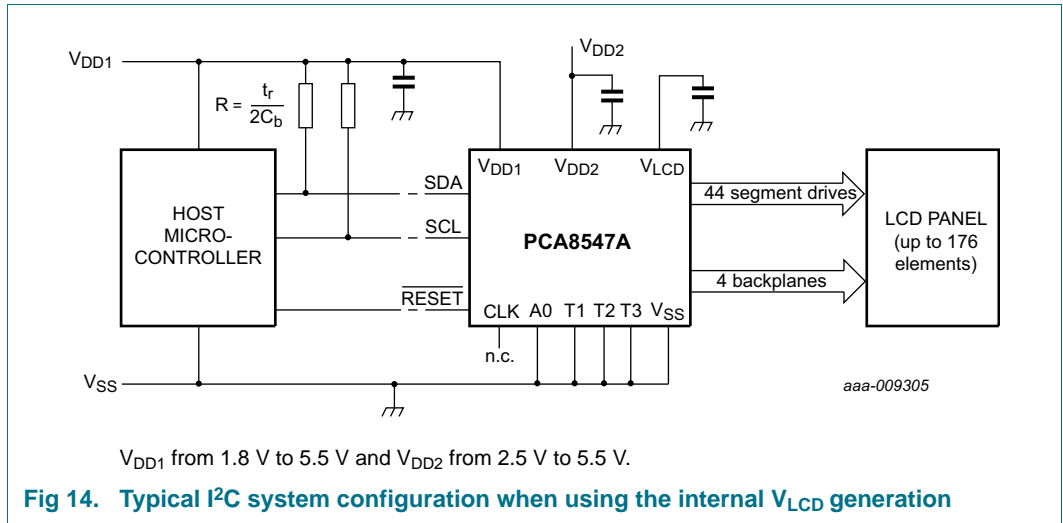

**Table 25. Selection of display configurations**

Number of			Digits/Characters		Dot matrix/ Elements
Backplanes	Segments	Icons	7 segment <sup>[1]</sup>	14 segment <sup>[2]</sup>	
4	44	176	22	11	176 dots (4 × 44)
2	44	88	11	5	88 dots (2 × 44)
1	44	44	5	2	44 dots (1 × 44)

[1] 7 segment display has 8 elements including the decimal point.

[2] 14 segment display has 16 elements including decimal point and accent dot.

All of the display configurations in [Table 25](#) can be implemented in the typical systems shown in [Figure 14](#) (internal V<sub>LCD</sub>) and in [Figure 15](#) (external V<sub>LCD</sub>).

The host microcontroller maintains the two-line I<sup>2</sup>C-bus communication channel with the PCA8547A or the three-line SPI-bus with the PCA8547B. The appropriate biasing voltages for the multiplexed LCD waveforms are generated internally. The only other connections required to complete the system are the power supplies ( $V_{DD1}$ ,  $V_{DD2}$ ,  $V_{SS}$ ,  $V_{LCD}$ ), the external capacitors, and the LCD panel selected for the application.

The recommended values for external capacitors on  $V_{DD1}$ ,  $V_{DD2}$ , and  $V_{LCD}$  are of nominal 100 nF value. When using bigger capacitors, especially on the  $V_{LCD}$ , the generated ripple will be consequently smaller. However it will take longer for the internal charge pump to first reach the target  $V_{LCD}$  voltage.

If  $V_{DD1}$  and  $V_{DD2}$  are connected externally, the capacitors on  $V_{DD1}$  and  $V_{DD2}$  can be replaced by a single capacitor with a nominal value of 220 nF.

**Remark:** In case of insufficient decoupling, ripple on  $V_{DD1}$  and  $V_{DD2}$  will create additional  $V_{LCD}$  ripple. The ripple on the  $V_{LCD}$  can be reduced by making the  $V_{SS}$  connection as low-ohmic as possible. Excessive ripple on  $V_{LCD}$  may cause flicker on the display.

### 8.4 LCD supply voltage

#### 8.4.1 External V<sub>LCD</sub> supply

V<sub>LCD</sub> can be directly supplied to the VLCD pin. In this case, the internal charge pump must not be enabled otherwise a high current may occur on pin VDD2 and pin VLCD. When V<sub>LCD</sub> is supplied externally, no internal temperature compensation occurs on this voltage even if bit TCE is set logic 1 (see [Section 8.4.4.2](#)). The V<sub>LCD</sub> voltage which is supplied externally will be available at the segments and backplanes of the device through the chosen bias system. Also programming VPR[7:0] will have no effect on the V<sub>LCD</sub> which is externally supplied.

#### 8.4.2 Internal V<sub>LCD</sub> generation

V<sub>LCD</sub> can be generated and controlled on the chip by using software commands. When the internal charge pump is used, the programmed V<sub>LCD</sub> is available on pin VLCD. The charge pump generates a V<sub>LCD</sub> of up to 3 × V<sub>DD2</sub>. The charge pump can be enabled or disabled with the CPE bit (see [Table 9 on page 9](#)). With bit CPC, the charge pump multiplier setting can be configured.

The final value of V<sub>LCD</sub> is a combination of the programmed V<sub>prog(LCD)</sub> value and the output of the temperature compensation block, V<sub>offset(LCD)</sub>.

$$V_{LCD} = V_{prog(LCD)} + V_{offset(LCD)} \tag{1}$$

The system is shown in [Figure 16](#).

Figure 17 illustrates how  $V_{LCD}$  changes with the programmed value of  $VPR[7:0]$ .

The programmable range of  $VPR[7:0]$  is from 0h to FFh. With the upper part of the programmable range, it is possible to achieve more than 9.0 V, but the PCA8547 has a built-in automatic limitation of  $V_{LCD}$  at 9.0 V. If  $V_{DD2}$  is higher than 3.0 V, then it is important that  $VPR[7:0]$  is set to a value such that the resultant  $V_{LCD}$  (including the temperature correction of  $VT[7:0]$ ) is higher than  $V_{DD2}$ .

### 8.4.3 Charge pump

#### 8.4.3.1 Charge pump configuration

To obtain the desired  $V_{LCD}$  values, the charge pump has to be configured properly. It has to be taken into account that the maximum theoretical values cannot be reached due to internal losses (see Section 8.4.3.2). So, for example, it is not possible to get a  $V_{LCD} = 6.0$  V with  $V_{DD2} = 3.0$  V and a charge pump configuration of 2 times  $V_{DD2}$ . In this case, a charge pump configuration of 3 times  $V_{DD2}$  is needed.

#### 8.4.3.2 Charge pump driving capability

Figure 18 and Figure 19 are showing the charge pump driving capability with different settings of  $V_{DD2}$  and charge pump configurations.

8.4.4 Temperature measurement and temperature compensation of  $V_{LCD}$

8.4.4.1 Temperature readout

The PCA8547 has a built-in temperature sensor which provides an 8 bit digital value, TD[7:0], of the ambient temperature. This value can be read through the interface (see [Figure 41 on page 49](#) and [Figure 45 on page 52](#)). The actual temperature is determined from TD[7:0] using [Equation 2](#):

$$T (^{\circ}\text{C}) = 0.9375 \times TD[7:0] - 40 \tag{2}$$

The measurement needs about 5 ms to complete and is repeated periodically as soon as bit TME is set logic 1 (see [Table 10 on page 10](#)). The time between measurements is linked to the system clock and hence varies with changes in the chosen frame frequency, see [Table 26](#).

**Table 26. Temperature measurement update rate**

Selected frame frequency	Temperature measurement update rate
60 Hz	3.3 s
200 Hz	1 s
300 Hz	0.67 s

The temperature sensor can be thought of as analog to digital converter. Like all A/D converters, jitter will exist on the LSB of the output value. This is also true of the temperature sensor in the PCA8547. Jitter of the LSB of TD[7:0] may lead to contrast

stepping of the display due to the  $V_{LCD}$  voltage is periodically changing between two different target voltages. For this reason, a filter has been implemented to ensure that LSB jitter does not affect the display performance.

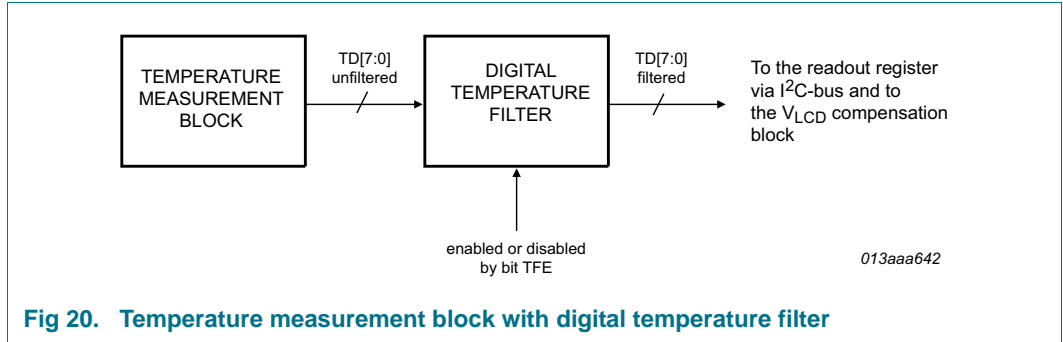

Fig 20. Temperature measurement block with digital temperature filter

Like any other filtering, the digital temperature filter (see Figure 20) introduces a certain delay in the measurement of temperature. This behavior is illustrated in Figure 21.

- (1) Environment temperature,  $T_1$  (°C).
- (2) Measured temperature,  $T_2$  (°C).
- (3) Temperature deviation,  $\Delta T = T_2 - T_1$ .

Fig 21. Temperature measurement delay during ramping up-down of the environment temperature

This delay may cause undesired effects at start-up when the environment temperature may be different than the reset value of the PCA8547 which is 20 °C. In this case, it takes up to 30 s until the correct measured temperature value will be available. A control bit, TFE (see Table 23 on page 15), is implemented to enable or disable the digital temperature filter. This bit is set logic 0 by default, which means, that the filter is disabled and the unfiltered environment temperature value is available to calculate the desired  $V_{LCD}$ .

8.4.4.2 Temperature adjustment of the  $V_{LCD}$

Due to the temperature dependency of the liquid crystal viscosity the LCD controlling voltage  $V_{LCD}$  might have to be adjusted at different temperatures to maintain optimal contrast. The temperature behavior of the liquid comes from the LCD manufacturer. The slope has to be set to compensate for the liquid behavior. Internal temperature compensation may be enabled via bit TCE (see [Table 10 on page 10](#)).

The ambient temperature range is split up into four equally sized regions and a different temperature coefficient can be applied to each. Each coefficient can be selected from a choice of eight different slopes. Each one of these coefficients may be independently selected (see [Table 27](#)).

Table 27. Temperature coefficients

SLA to SLD register value	Corresponding slope factor, SFA to SFD (mV/°C)
000 <sup>[1]</sup>	0
001	-4
010	-8
011	-16
100	-40
101	+4
110	+8
111	+16

[1] Default value.

The slope factors imply a linear correction, however the implementation is in steps of 30 mV.

Fig 22. Example of segmented temperature coefficients

The offset voltage is calculated according to [Table 28](#).

**Table 28. Calculation of the  $V_{LCD}$  offset voltage**

Temperature range	$V_{offset(LCD)}$ voltage (mV)
$T \leq -40\text{ °C}$	$V_{offset(LCD)} = 30 \times SFA + 30 \times SFB$
$-40\text{ °C} \leq T \leq -10\text{ °C}$	$V_{offset(LCD)} = (-10 - T) \times SFA + 30 \times SFB$
$-10\text{ °C} < T \leq 20\text{ °C}$	$V_{offset(LCD)} = (20 - T) \times SFB$
$20\text{ °C} < T \leq 50\text{ °C}$	$V_{offset(LCD)} = (T - 20) \times SFC$
$50\text{ °C} < T < 80\text{ °C}$	$V_{offset(LCD)} = (T - 50) \times SFD + 30 \times SFC$
$80\text{ °C} \leq T$ <sup>[1]</sup>	$V_{offset(LCD)} = 30 \times SFD + 30 \times SFC$

[1] No temperature compensation is possible above 80 °C. Above this value, the system maintains the compensation value from 80 °C.

**Example:** Assumed that  $T_{amb} = -8\text{ °C}$ ;  $SFB = -16\text{ mV/°C}$ :

$$V_{offset(LCD)} = (20 - -8) \times (-16) = 28 \times (-16) = -448\text{ mV}$$

**Remark:** Care must be taken that the ranges of VPR[7:0] and VT[7:0] do not cause clipping and hence undesired results. The device will not permit overflow or underflow and will clamp results to either end of the range.

### 8.4.5 LCD voltage selector

The LCD voltage selector co-ordinates the multiplexing of the LCD in accordance with the selected LCD drive configuration. The operation of the voltage selector is controlled by the Set-bias-mode command (see [Table 15 on page 12](#)) and the Set-MUX-mode command (see [Table 14 on page 11](#)).

Intermediate LCD biasing voltages are obtained from an internal voltage divider. The biasing configurations that apply to the preferred modes of operation, together with the biasing characteristics as functions of  $V_{LCD}$  and the resulting discrimination ratios (D), are given in [Table 29](#).

Discrimination is a term which is defined as the ratio of the one and off RMS voltage across a segment. It can be thought of as a measurement of contrast.

**Table 29. LCD drive modes: summary of characteristics**

LCD drive mode	Number of:		LCD bias configuration	$\frac{V_{off(RMS)}}{V_{LCD}}$	$\frac{V_{on(RMS)}}{V_{LCD}}$	$D = \frac{V_{on(RMS)}}{V_{off(RMS)}}$ <sup>[1]</sup>	$V_{LCD}$ <sup>[2]</sup>
	Backplanes	Bias levels					
static	1	2	static	0	1	$\infty$	$V_{on(RMS)}$
1:2 multiplex	2	3	$\frac{1}{2}$	0.354	0.791	2.236	$2.828 V_{off(RMS)}$
1:2 multiplex	2	4	$\frac{1}{3}$	0.333	0.745	2.236	$3.0 V_{off(RMS)}$
1:2 multiplex <sup>[3]</sup>	2	5	$\frac{1}{4}$	0.395	0.729	1.845	$2.529 V_{off(RMS)}$
1:4 multiplex <sup>[3]</sup>	4	3	$\frac{1}{2}$	0.433	0.661	1.527	$2.309 V_{off(RMS)}$
1:4 multiplex	4	4	$\frac{1}{3}$	0.333	0.577	1.732	$3.0 V_{off(RMS)}$
1:4 multiplex <sup>[3]</sup>	4	5	$\frac{1}{4}$	0.331	0.545	1.646	$3.024 V_{off(RMS)}$

[1] Determined from [Equation 5](#).

[2] Determined from [Equation 4](#).

[3] In these examples, the discrimination factor and hence the contrast ratios are smaller. The advantage of these LCD drive modes is a power saving from a reduction of the LCD voltage  $V_{LCD}$ .

A practical value for  $V_{LCD}$  is determined by equating  $V_{off(RMS)}$  with a defined LCD threshold voltage ( $V_{th}$ ), typically when the LCD exhibits approximately 10 % contrast. In the static drive mode, a suitable choice is  $V_{LCD} > 3V_{th}$ .

Bias is calculated by  $\frac{1}{1+a}$ , where the values for  $a$  are

$a = 1$  for  $\frac{1}{2}$  bias

$a = 2$  for  $\frac{1}{3}$  bias

$a = 3$  for  $\frac{1}{4}$  bias

The RMS on-state voltage ( $V_{on(RMS)}$ ) for the LCD is calculated with [Equation 3](#)

$$V_{on(RMS)} = V_{LCD} \sqrt{\frac{a^2 + 2a + n}{n \times (1 + a)^2}} \quad (3)$$

where  $V_{LCD}$  is the resultant voltage at the LCD segment and where the values for  $n$  are

$n = 1$  for static mode

$n = 2$  for 1:2 multiplex

$n = 4$  for 1:4 multiplex

The RMS off-state voltage ( $V_{off(RMS)}$ ) for the LCD is calculated with [Equation 4](#):

$$V_{off(RMS)} = V_{LCD} \sqrt{\frac{a^2 - 2a + n}{n \times (1 + a)^2}} \quad (4)$$

Discrimination is the ratio of  $V_{on(RMS)}$  to  $V_{off(RMS)}$  and is determined from [Equation 5](#):

$$\frac{V_{on(RMS)}}{V_{off(RMS)}} = \sqrt{\frac{(a + 1)^2 + (n - 1)}{(a - 1)^2 + (n - 1)}} \quad (5)$$

It should be noted that  $V_{LCD}$  is sometimes referred as the LCD operating voltage.

#### 8.4.5.1 Electro-optical performance

Suitable values for  $V_{on(RMS)}$  and  $V_{off(RMS)}$  are dependent on the LCD liquid used. The RMS voltage, at which a pixel will be switched on or off, determine the transmissibility of the pixel.

For any given liquid, there are two threshold values defined. One point is at 10 % relative transmission (at  $V_{th(off)}$ ) and the other at 90 % relative transmission (at  $V_{th(on)}$ ), see [Figure 23](#). For a good contrast performance, the following rules should be followed:

$$V_{on(RMS)} \geq V_{th(on)} \quad (6)$$

$$V_{off(RMS)} \leq V_{th(off)} \quad (7)$$

$V_{on(RMS)}$  and  $V_{off(RMS)}$  are properties of the display driver and are affected by the selection of  $a$  (see [Equation 3](#)),  $n$  (see [Equation 5](#)), and the  $V_{LCD}$  voltage.

$V_{th(off)}$  and  $V_{th(on)}$  are properties of the LCD liquid and can be provided by the module manufacturer.  $V_{th(off)}$  is sometimes just named  $V_{th}$ .  $V_{th(on)}$  is sometimes named saturation voltage  $V_{sat}$ .

It is important to match the module properties to those of the driver in order to achieve optimum performance.

Fig 23. Electro-optical characteristic: relative transmission curve of the liquid

8.4.6 LCD drive mode waveforms

8.4.6.1 Static drive mode

The static LCD drive mode is used when a single backplane is provided in the LCD.

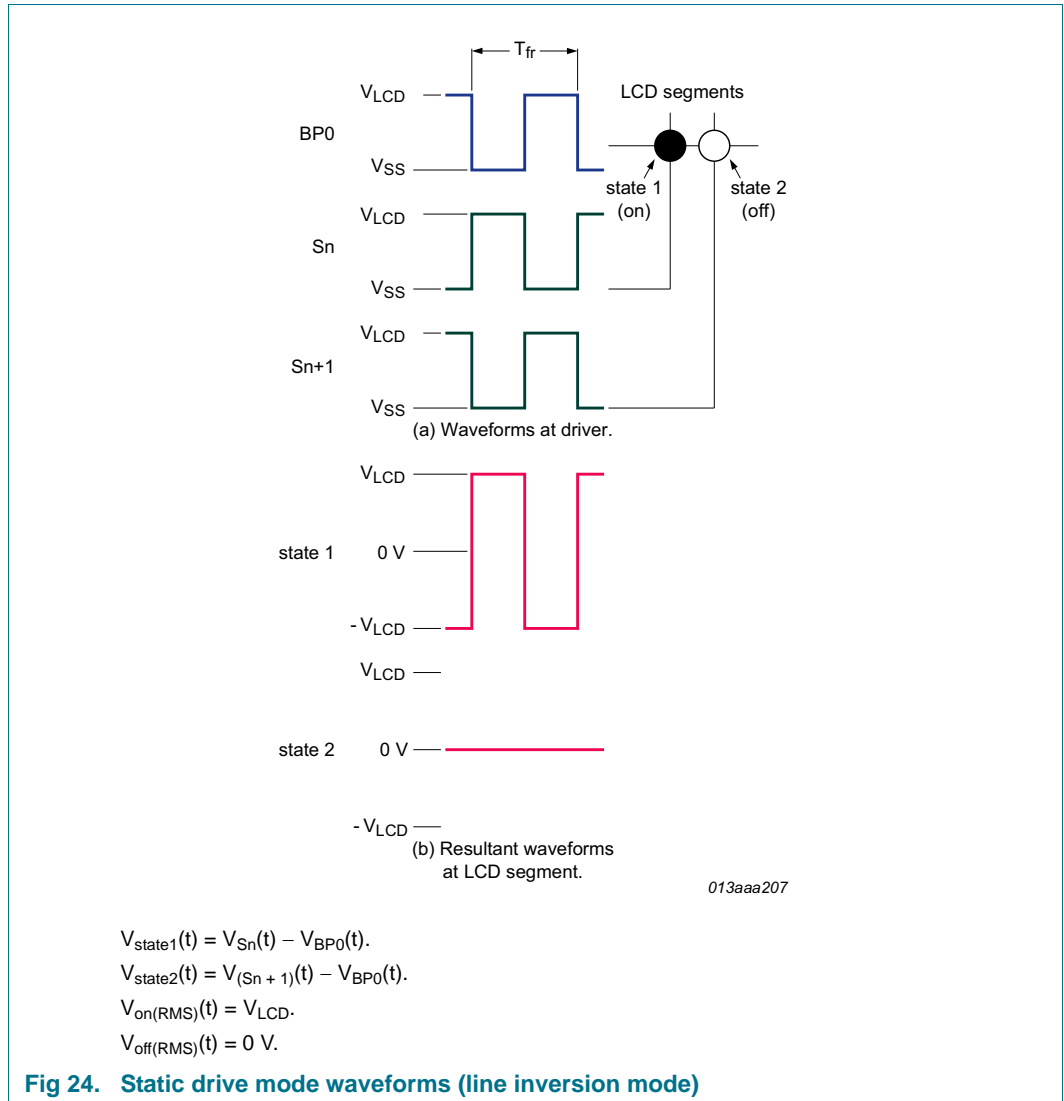

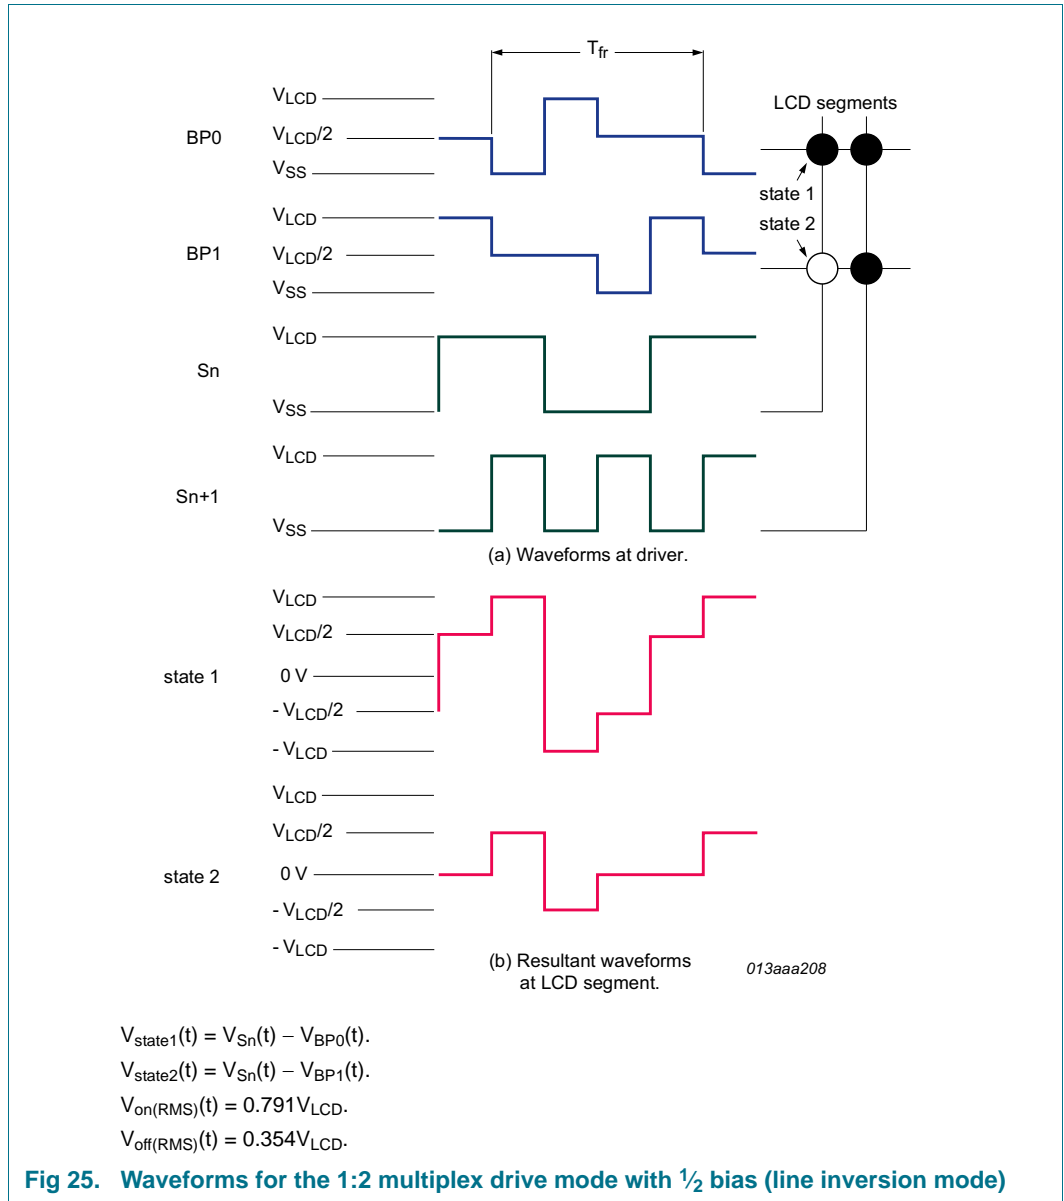

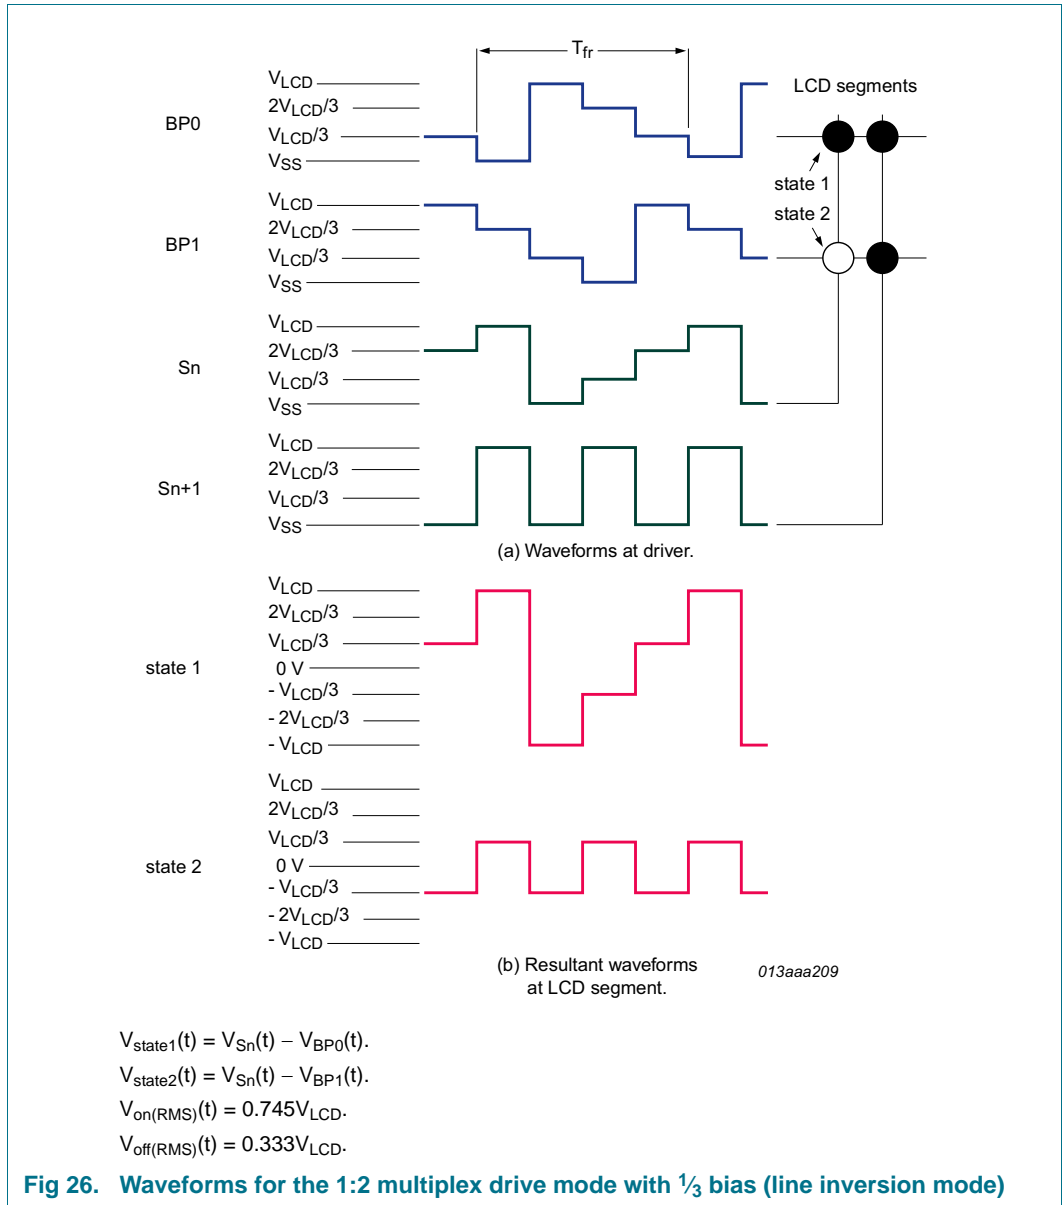

Fig 24. Static drive mode waveforms (line inversion mode)

8.4.6.2 1:2 multiplex drive mode

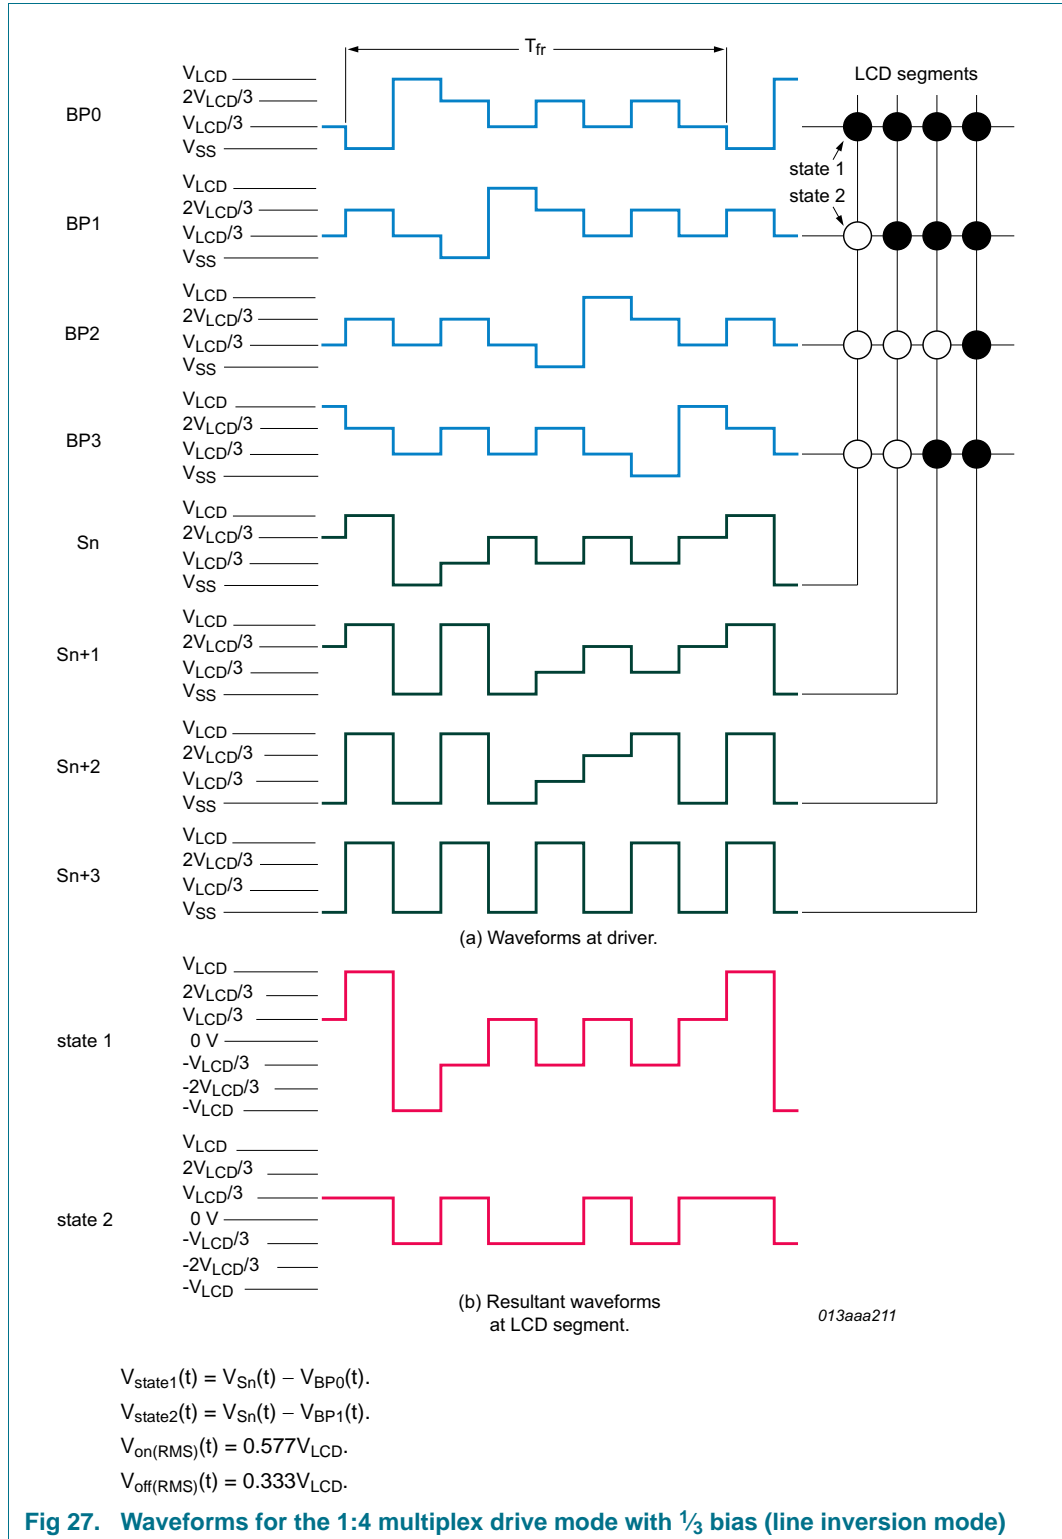

When two backplanes are provided in the LCD, the 1:2 multiplex mode applies. The PCA8547 allows the use of 1/2 bias or 1/3 bias in this mode as shown in Figure 25 and Figure 26.

8.4.6.3 1:4 multiplex drive mode

When four backplanes are provided in the LCD, the 1:4 multiplex drive mode applies, as shown in Figure 27.

## 8.5 Backplane and segment outputs

### 8.5.1 Backplane outputs

The LCD drive section includes four backplane outputs: BP0 to BP3. The backplane output signals are generated based on the selected LCD multiplex drive mode.

[Table 30](#) describes which outputs are active for each of the multiplex drive modes and what signal is generated.

**Table 30. Mapping of output pins and corresponding signals with respect to driving mode**

MUX mode	Output pin			
	BP0	BP1	BP2	BP3
	Signal			
1:4	BP0	BP1	BP2	BP3
1:2	BP0	BP1	BP0 <sup>[1]</sup>	BP1 <sup>[1]</sup>
static	BP0	BP0 <sup>[1]</sup>	BP0 <sup>[1]</sup>	BP0 <sup>[1]</sup>

[1] These pins may optionally or alternatively be connected to the display to improve drive strength. Connect only with the corresponding output pin carrying the same signal. If not required, they can be left open circuit.

#### 8.5.1.1 1:4 multiplex drive mode

In the 1:4 multiplex drive mode, BP0 to BP3 must be connected directly to the LCD.

#### 8.5.1.2 1:2 multiplex drive mode

In the 1:2 multiplex drive mode, BP0 and BP1 must be connected directly to the LCD.

The unused BPs may be left open-circuit. Optionally they may also be connected to the display to increase drive strength.

- BP0 is repeated on BP2
- BP1 is repeated on BP3

#### 8.5.1.3 Static drive mode

In the static drive mode, BP0 must be connected directly to the LCD.

In the static drive mode, the same signal is carried by all four backplane outputs and they can be connected in parallel for very high drive requirements.

- BP0 is repeated on BP1, BP2, and BP3

### 8.5.2 Segment outputs

The LCD drive section includes up to 44 segment outputs.

The segment output signals are generated based on the multiplexed backplane signals and with data resident in the display register. When less than 44 segment outputs are required, the unused segment outputs must be left open-circuit.

## 8.6 Display controller

The display controller executes the commands identified by the command decoder. It contains the status registers of the PCA8547 and co-ordinates their effects. The controller is also responsible for loading display data into the display RAM as required by the filling order.

## 8.7 Display register

The display register holds the display data while the corresponding multiplex signals are generated.

## 8.8 Display RAM

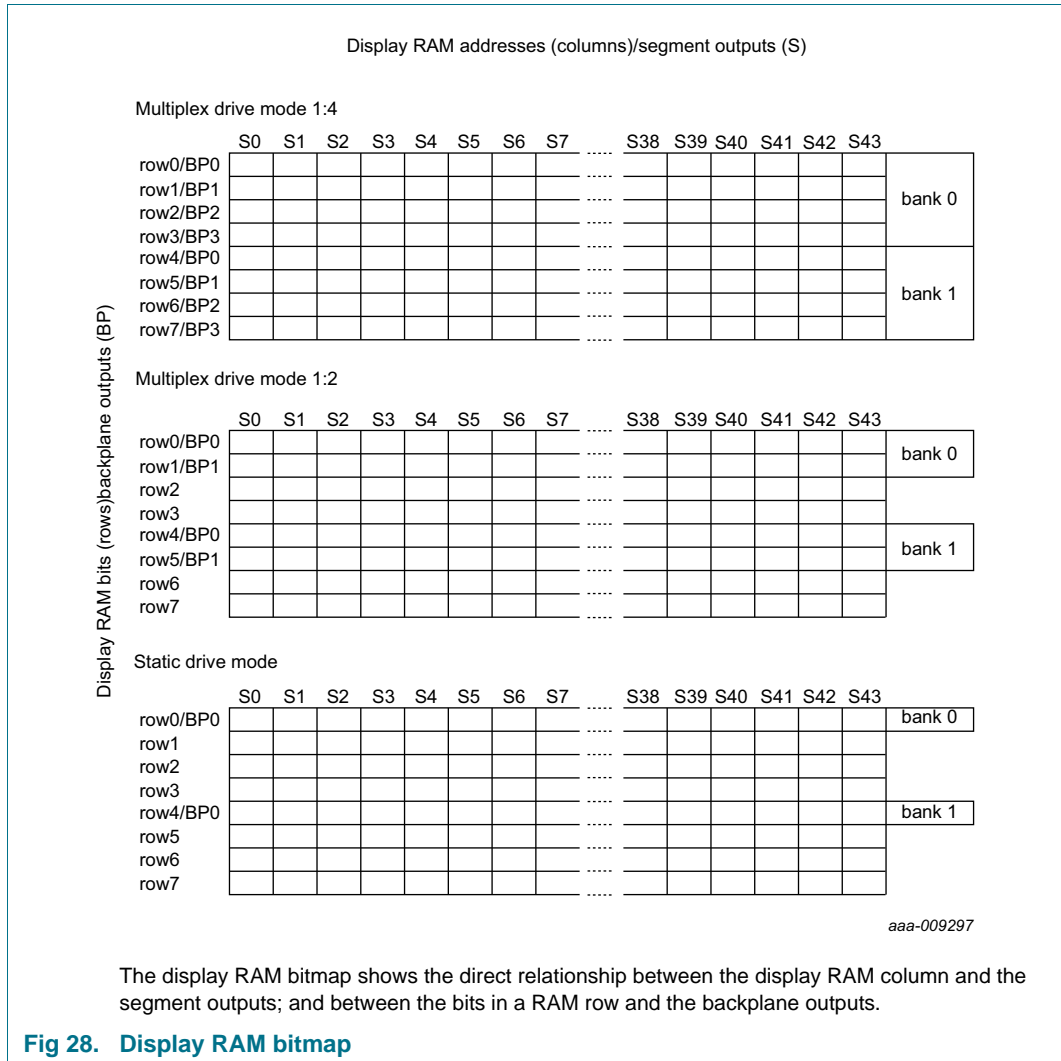

The display RAM stores LCD data. Depending on the multiplex drive mode, the arrangement of the RAM is changed.

- multiplex drive mode 1:4: RAM is  $44 \times 4$  bit arranged in two banks
- multiplex drive mode 1:2: RAM is  $44 \times 2$  bit arranged in two banks
- static drive mode: RAM is  $44 \times 1$  bit arranged in two banks

A logic 1 in the RAM bit map indicates the on-state of the corresponding LCD element; similarly, a logic 0 indicates the off-state.

There is a one-to-one correspondence between

- the bits in the RAM bitmap and the LCD elements,
- the RAM columns and the segment outputs,
- the RAM rows and the backplane outputs.

The display RAM bit map, [Figure 28](#), shows row 0 to row 7 which correspond with the backplane outputs BP0 to BP3, and column 0 to column 43 which correspond with the segment outputs S0 to S43. The number of rows is twice the number of backplane outputs allowing to use two different RAM banks (see [Section 8.9](#)).

When display data is transmitted to the PCA8547, the display bytes received are stored in the display RAM in accordance with the selected LCD multiplex drive mode. The data is stored as it arrives. Depending on the current multiplex drive mode, data is stored singularly, in pairs, or quadruples.

**8.8.1 Data pointer**

The addressing mechanism for the display RAM is realized using the data pointer. This allows the loading of an individual display data byte, or a series of display data bytes, into any location of the display RAM. The sequence commences with the initialization of the data pointer by the Load-data-pointer command (see [Table 16 on page 12](#)).

Following this command, an arriving data byte is stored starting at the display RAM address indicated by the data pointer.

After each byte stored, the data pointer is automatically incremented in accordance with the chosen LCD multiplex drive mode configuration:

- by eight (static drive mode)
- by four (1:2 multiplex drive mode)
- by two (1:4 multiplex drive mode)

When the address counter reaches the end of the RAM row, it stops incrementing after the last byte is transmitted. Redundant bits of the last byte transmitted are discarded. Additional bytes, sent after the end of the RAM is reached, will be discarded too. The data pointer does not wrap around to the beginning. To send new RAM data, the data pointer must be reset.

If an I<sup>2</sup>C-bus or SPI-bus data access is terminated early, then the state of the data pointer is unknown. The data pointer must then be re-written before further RAM accesses.

### 8.8.2 RAM filling in static drive mode

In the static drive mode the eight transmitted data bits are placed in eight successive display RAM columns in row 0 (see [Figure 29](#)).

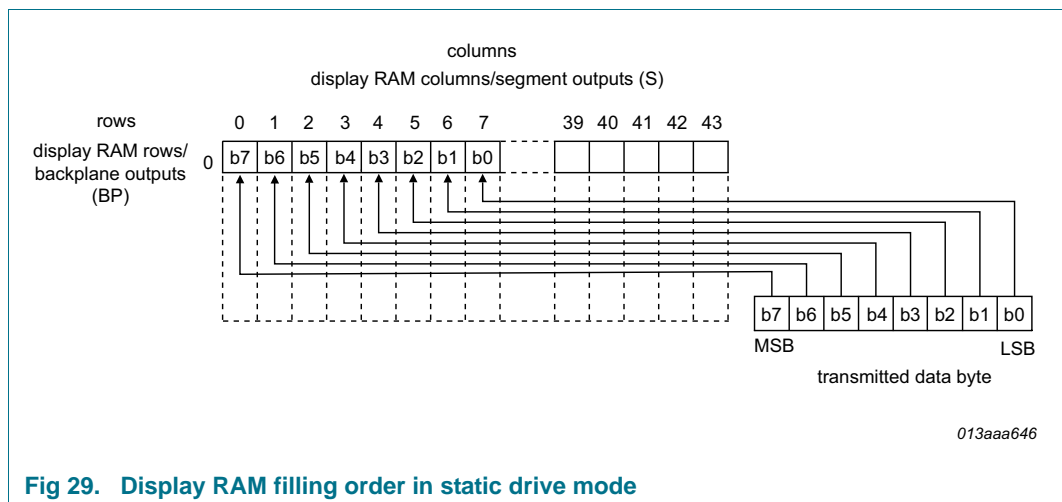

Fig 29. Display RAM filling order in static drive mode

In order to fill the whole RAM row, 6 bytes must be sent to the PCA8547, but the last 4 bits from the last byte are discarded (see [Figure 30](#)).

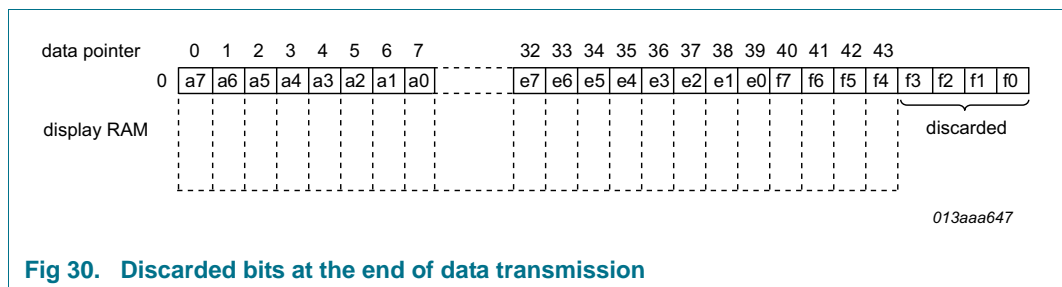

Fig 30. Discarded bits at the end of data transmission

When bit IBS is set to bank 1 (see [Table 19 on page 14](#)), then data is stored in row 4.

8.8.3 RAM filling in 1:2 multiplex drive mode

In the 1:2 multiplex drive mode the eight transmitted data bits are placed in four successive display RAM columns (see Figure 31). In order to fill the whole two RAM rows 11 bytes need to be sent to the PCA8547.

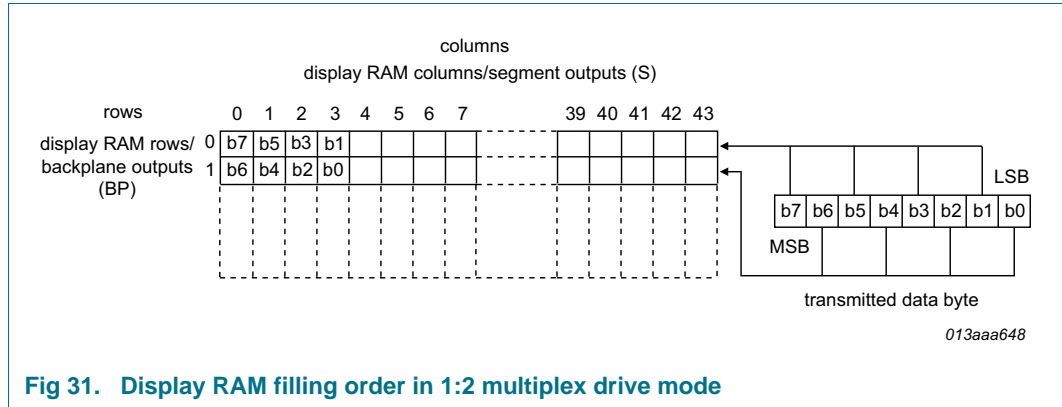

Fig 31. Display RAM filling order in 1:2 multiplex drive mode

When bit IBS is set to bank 1 (see Table 19 on page 14), then data is stored in row 4 and row 5.

8.8.4 RAM filling in 1:4 multiplex drive mode

In the 1:4 multiplex drive mode the eight transmitted data bits are placed in two successive display RAM columns of four rows (see Figure 32). In order to fill the whole four RAM rows 22 bytes need to be sent to the PCA8547.

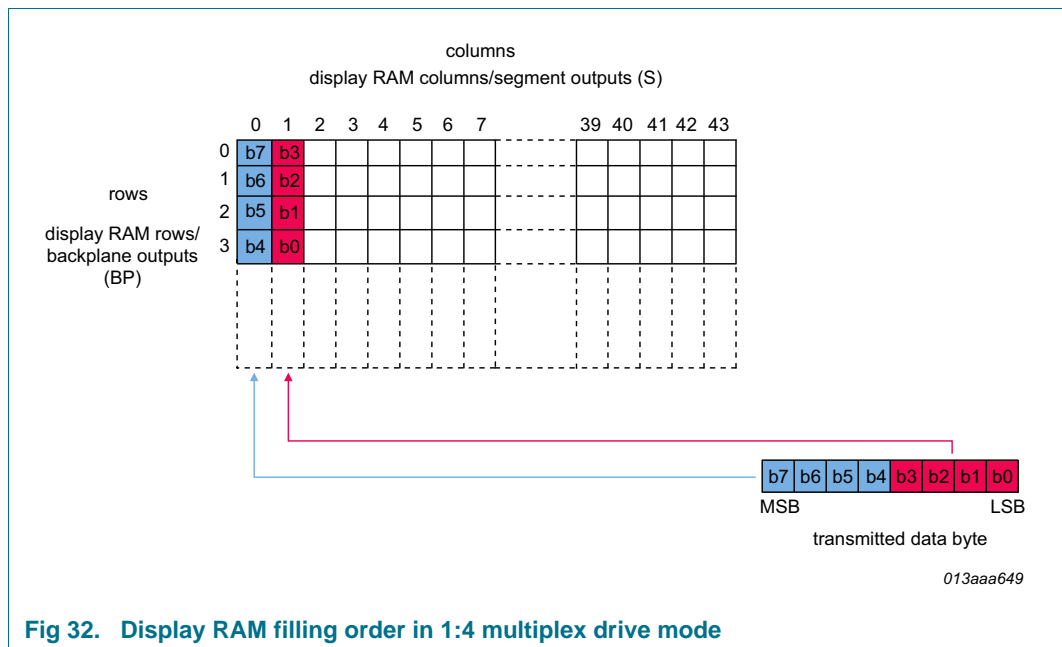

Fig 32. Display RAM filling order in 1:4 multiplex drive mode

When bit IBS is set to bank 1 (see Table 19 on page 14), then data is stored in rows 4 to row 7.

### 8.9 Bank selection

The PCA8547 includes a RAM bank switching feature. A bank can be thought of as a collection of RAM rows. The RAM bank switching gives the provision for preparing display information in an alternative bank and to be able to switch to it once it is complete.

There are two banks; bank 0 and bank 1. [Figure 28 on page 40](#) shows the location of these banks relative to the RAM map. Input and output banks can be set independently from one another with the Bank-select command (see [Table 19 on page 14](#)). [Figure 33](#) shows the concept.

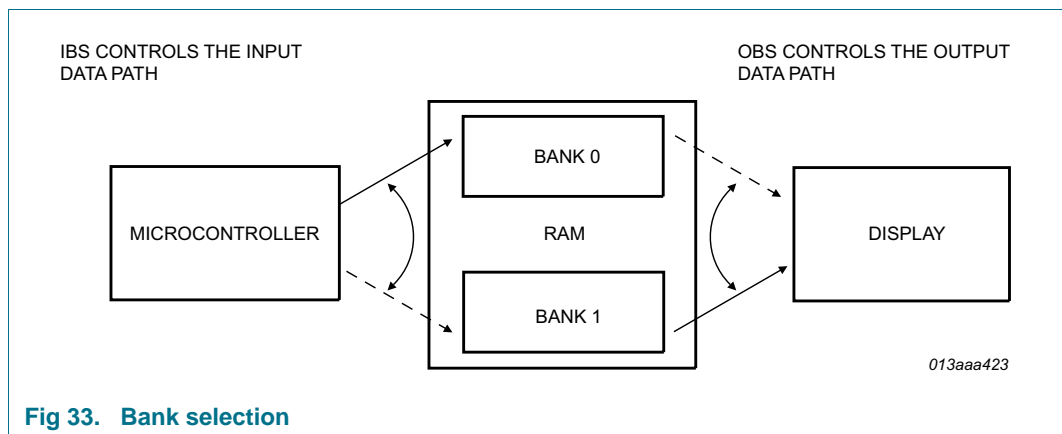

Fig 33. Bank selection

In [Figure 34](#) an example is shown for 1:4 multiplex drive mode where the displayed data is read from the first four rows of the memory (bank 0), while the transmitted data is stored in the second four rows of the memory (bank 1).

Fig 34. Example of the Bank-select command with multiplex drive mode 1:4

#### 8.9.1 Input bank selection

The IBS (input bank selection) bit of the Bank-select command (see [Table 19](#)) controls where display data is loaded into the display RAM.

The input bank selection works independently of output bank selection.

### 8.9.2 Output bank selection

The OBS bit of the Bank-select command (see [Table 19 on page 14](#)) controls from which bank display data is taken,

The output bank selection works independently of input bank selection.

## 9. Bus interfaces

### 9.1 Control byte

After initiating the communication over the bus and sending the slave address (I<sup>2</sup>C-bus, see [Section 9.2](#)) or subaddress (SPI-bus, see [Section 9.3](#)), a control byte follows. The purpose of this byte is to indicate both, the content for the following data bytes (RAM or command) and to indicate that more control bytes will follow.

Typical sequences could be:

- Slave address/subaddress - control byte - command byte - command byte - command byte - end
- Slave address/subaddress - control byte - RAM byte - RAM byte - RAM byte - end
- Slave address/subaddress - control byte - command byte - control byte - RAM byte - end

In this way, it is possible to send a mixture of RAM and command data in one access or alternatively, to send just one type of data in one access.

**Table 31. Control byte description**

Bit	Symbol	Binary value	Description
7	CO		<b>continue bit</b>
		0	last control byte
		1	control bytes continue
6	RS		<b>register selection</b>
		0	command register
		1	data register
5 to 0	-		not relevant

**Fig 35. Control byte format**

## 9.2 I<sup>2</sup>C-bus interface characteristics (PCA8547A)

The I<sup>2</sup>C-bus is for bidirectional, two-line communication between different ICs or modules. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

### 9.2.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as a control signal (see [Figure 36](#)).

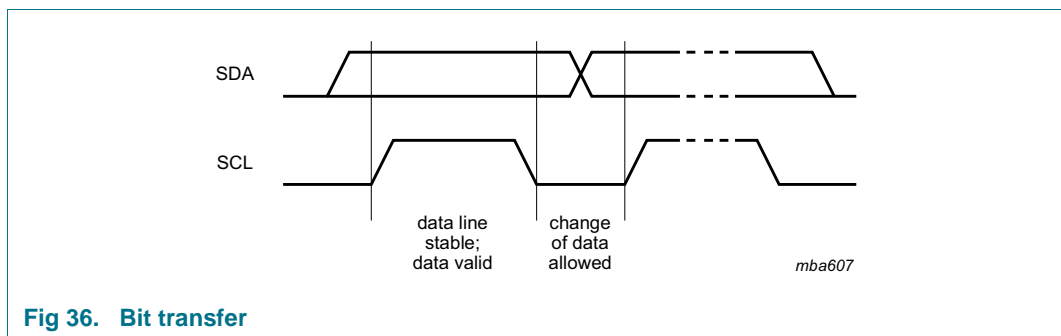

Fig 36. Bit transfer

### 9.2.2 START and STOP conditions

Both data and clock lines remain HIGH when the bus is not busy.

A HIGH-to-LOW change of the data line, while the clock is HIGH is defined as the START condition (S).

A LOW-to-HIGH change of the data line while the clock is HIGH is defined as the STOP condition (P).

The START and STOP conditions are shown in [Figure 37](#).

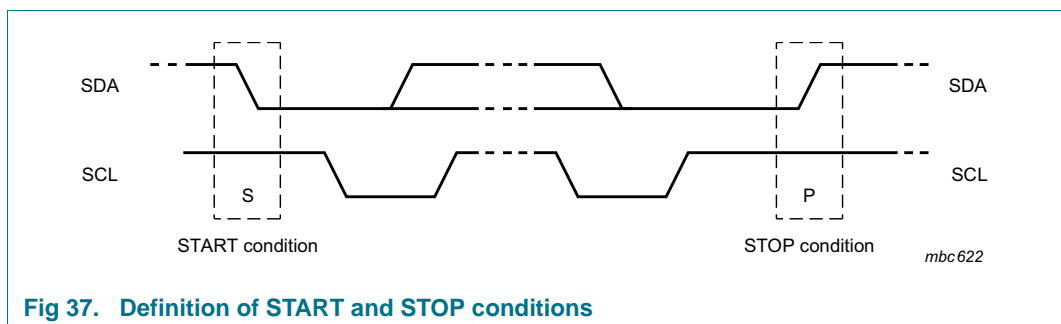

Fig 37. Definition of START and STOP conditions

### 9.2.3 System configuration

A device generating a message is a transmitter, a device receiving a message is the receiver. The device that controls the message is the master and the devices which are controlled by the master are the slaves. The system configuration is shown in [Figure 38](#).

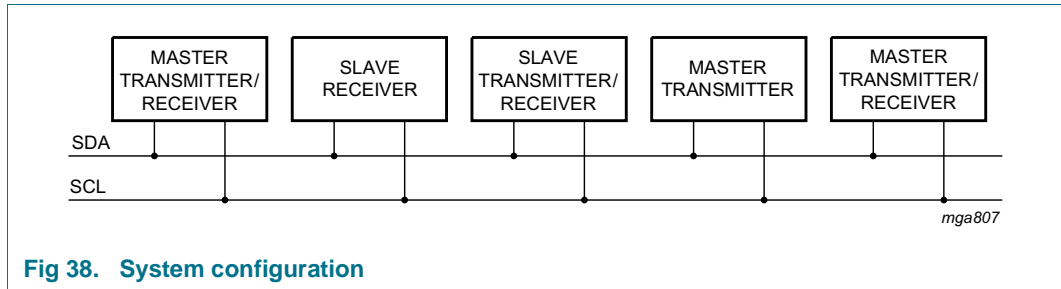

Fig 38. System configuration

9.2.4 Acknowledge

The number of data bytes transferred between the START and STOP conditions from transmitter to receiver is unlimited. Each byte of 8 bits is followed by an acknowledge cycle.

- A slave receiver which is addressed must generate an acknowledge after the reception of each byte.
- Also a master receiver must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter.
- The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be considered).
- A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line HIGH to enable the master to generate a STOP condition.

Acknowledgement on the I<sup>2</sup>C-bus is shown in [Figure 39](#).

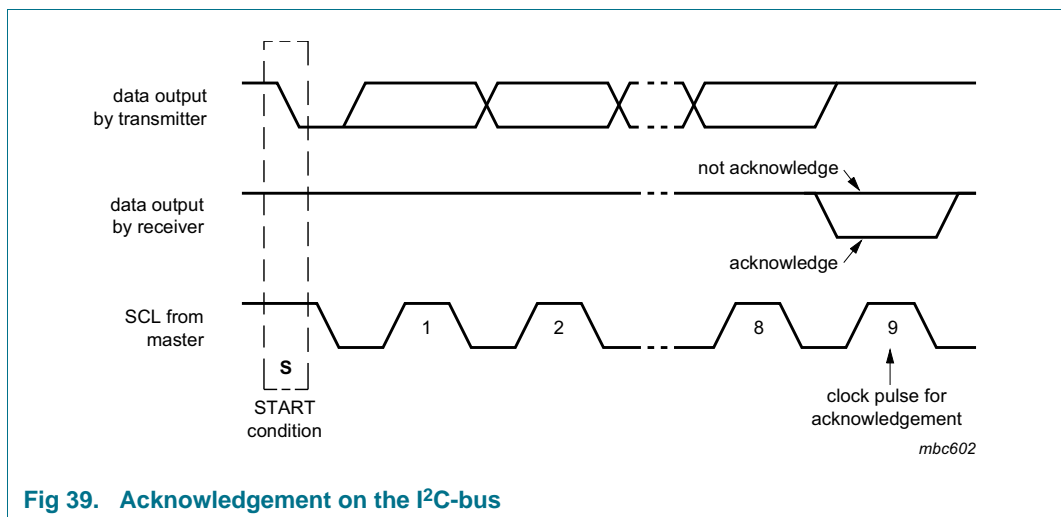

Fig 39. Acknowledgement on the I<sup>2</sup>C-bus

9.2.5 I<sup>2</sup>C-bus controller

The PCA8547A acts as an I<sup>2</sup>C-bus slave receiver. It does not initiate I<sup>2</sup>C-bus transfers or transmit data to an I<sup>2</sup>C-bus master receiver. The only data output from PCA8547A are the acknowledge signals and the temperature readout byte of the selected device.

### 9.2.6 Input filters

To enhance noise immunity in electrically adverse environments, RC low-pass filters are provided on the SDA and SCL lines.

### 9.2.7 I<sup>2</sup>C-bus slave address

The device selection depends on the I<sup>2</sup>C-bus slave address.

Two different I<sup>2</sup>C-bus slave addresses can be used to address the PCA8547A (see [Table 32](#)).

**Table 32. I<sup>2</sup>C slave address byte**

Bit	Slave address							0 LSB
	7 MSB	6	5	4	3	2	1	
	0	1	1	1	0	0	A0	R/ $\overline{W}$

Bit 1 of the slave address is defined by connecting the input A0 to either V<sub>SS</sub> (logic 0) or V<sub>DD</sub> (logic 1). Therefore, two instances of PCA8547A can be distinguished on the same I<sup>2</sup>C-bus.

The least significant bit of the slave address byte is bit R/ $\overline{W}$  (see [Table 33](#)).

**Table 33. R/ $\overline{W}$  bit description**

Symbol	Value	Description
R/ $\overline{W}$	<b>data read or write selection</b>	
	0	write data
	1	read data <sup>[1]</sup>

[1] Only used for temperature readout from PCA8547A (see [Table 21 on page 14](#)).

### 9.2.8 I<sup>2</sup>C-bus protocol

The I<sup>2</sup>C-bus protocol is shown in [Figure 40](#). The sequence is initiated with a START condition (S) from the I<sup>2</sup>C-bus master which is followed by one of the two PCA8547A slave addresses available. All PCA8547A's with the corresponding A0 level acknowledge in parallel to the slave address, but all PCA8547A with an alternative A0 level ignore the whole I<sup>2</sup>C-bus transfer.

After acknowledgement, a control byte follows (see [Section 9.1 on page 45](#)).

Fig 40. I<sup>2</sup>C-bus protocol, write mode

The display bytes are stored in the display RAM at the address specified by the data pointer.

The acknowledgement after each byte is made only by the addressed PCA8547A. After the last display byte, the I<sup>2</sup>C-bus master issues a STOP condition (P). Alternatively a START may be issued to RESTART an I<sup>2</sup>C-bus access.

### 9.2.9 Data read

If a temperature readout (byte TD[7:0]) is made, the R/W bit must be logic 1 and then the next data byte following is provided by the PCA8547A as shown in [Figure 41](#).

Fig 41. I<sup>2</sup>C-bus protocol, read mode

### 9.3 SPI-bus interface (PCA8547B)

Data transfer to the device is made via a three-line SPI-bus (see [Table 31](#)). The SPI-bus is reset whenever the chip enable pin  $\overline{CE}$  is inactive.

**Table 34. Serial interface**

Pin	Function	Description
$\overline{CE}$	chip enable input; active LOW <sup>[1]</sup>	when HIGH, the interface is reset;
SCL	serial clock input	-
SDIO	serial data input output	input data is sampled on the rising edge of SCL; data is output on the falling edge of SCL

[1] The chip enable must not be wired permanently LOW.

#### 9.3.1 Data transmission

The chip enable signal is used to identify the transmitted data. Each data transfer is a byte, with the Most Significant Bit (MSB) sent first.

The transmission is controlled by the active LOW chip enable signal  $\overline{CE}$ . The first byte transmitted is the subaddress byte.

**Fig 42. Data transfer overview**

The subaddress byte opens the communication with a read/write bit and a subaddress. The subaddress is used to identify multiple devices on one SPI-bus.

**Table 35. Subaddress byte definition**

Bit	Symbol	Binary value	Description
7	$R/\overline{W}$		<b>data read or write selection</b>
		0	write data
		1	read data <sup>[1]</sup>
6 to 5	SA[1:0]	01	<b>subaddress</b> ; other codes will cause the device to ignore data transfer
4 to 0	-	-	unused

[1] Only used for temperature readout from PCA8547B (see [Table 21 on page 14](#)).

After the subaddress byte, a control byte follows (see [Section 9.1 on page 45](#)).

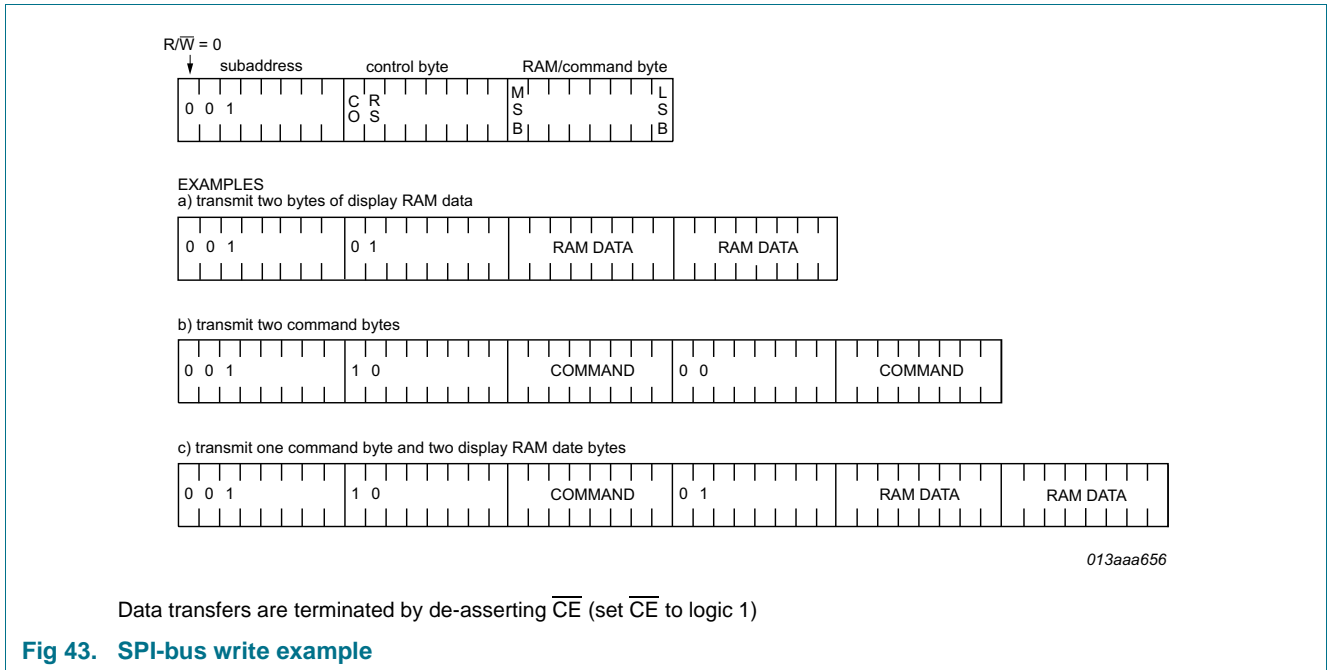

Fig 43. SPI-bus write example

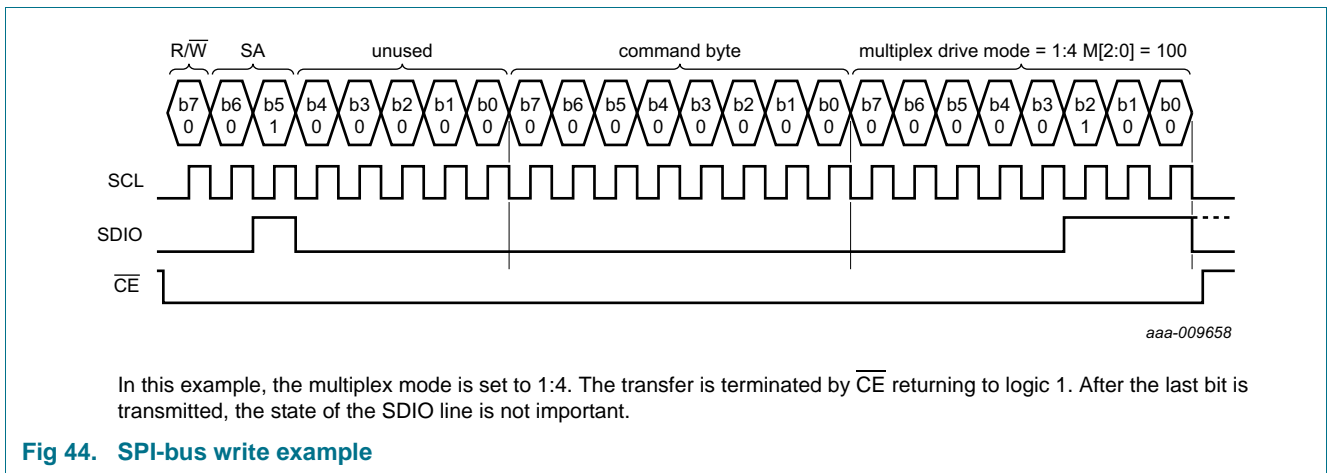

Fig 44. SPI-bus write example

### 9.3.2 Data read

The temperature readout data byte TD[7:0] can be read from the PCA8547B.

A readout is initiated by sending the subaddress byte with the R/W bit set high. The transmission is controlled by the active LOW chip enable signal  $\overline{CE}$ .

After the last bit of the subaddress byte is transmitted, the PCA8547B will immediately start to drive the SDIO line. It is only necessary to read the values once, however since the update of the register is asynchronous to the interface clock, it is recommended to read the register twice and check for a stable value.

The readout is terminated by asserting  $\overline{CE}$ . At this time, the SDIO bus is released. It is important that the bus is not left floating and that the microcontroller then takes over driving of the bus.

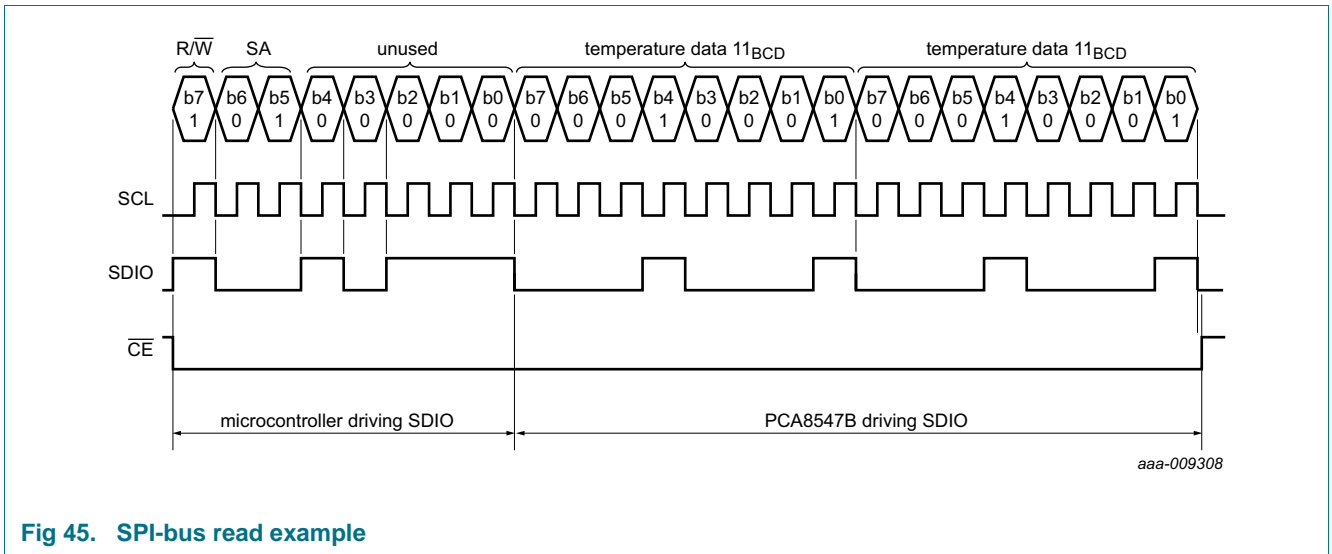

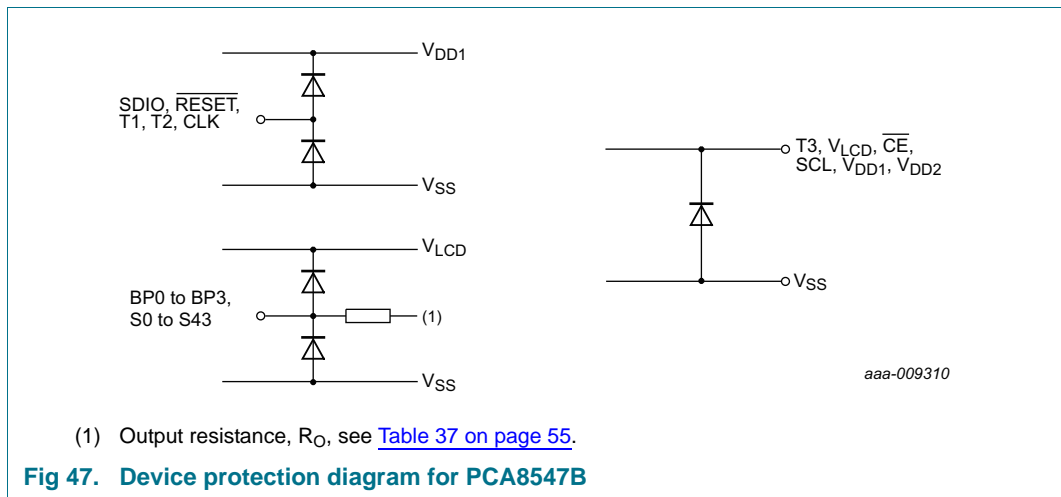

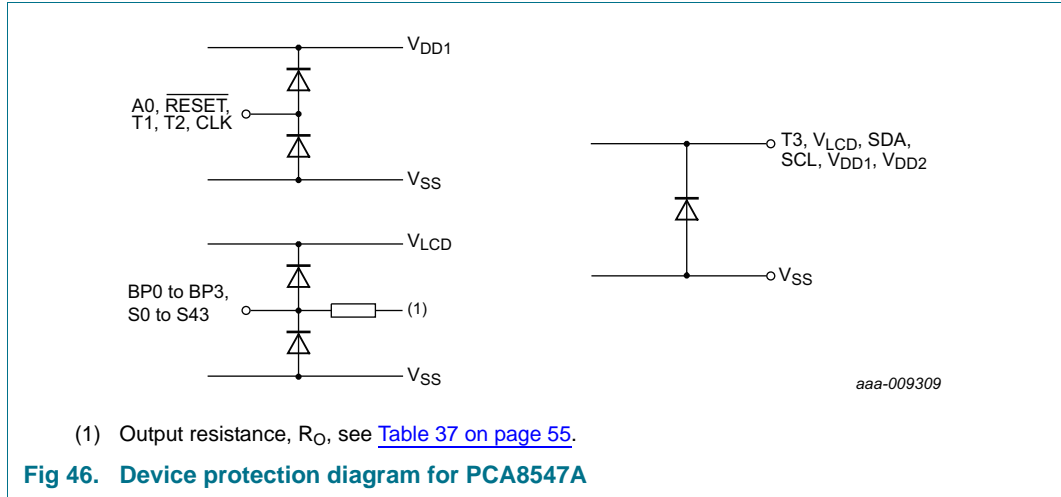

Fig 45. SPI-bus read example

10. Internal circuitry

11. Safety notes

CAUTION

This device is sensitive to ElectroStatic Discharge (ESD). Observe precautions for handling electrostatic sensitive devices.

Such precautions are described in the *ANSI/ESD S20.20*, *IEC/ST 61340-5*, *JESD625-A* or equivalent standards.

CAUTION

Static voltages across the liquid crystal display can build up when the LCD supply voltage ( $V_{LCD}$ ) is on while the IC supply voltage ( $V_{DD}$ ) is off, or vice versa. This may cause unwanted display artifacts. To avoid such artifacts,  $V_{LCD}$  and  $V_{DD}$  must be applied or removed together.

## 12. Limiting values

**Table 36. Limiting values**

*In accordance with the Absolute Maximum Rating System (IEC 60134).*

Symbol	Parameter	Conditions	Min	Max	Unit
V <sub>DD1</sub>	supply voltage 1	digital	-0.5	+6.5	V

## 15. Test information

### 15.1 Quality information

This product has been qualified in accordance with the Automotive Electronics Council (AEC) standard Q100 - *Failure mechanism based stress test qualification for integrated circuits*, and is suitable for use in automotive applications.

16. Package outline

TQFP64: plastic thin quad flat package; 64 leads; body 10 x 10 x 1.0 mm

SOT357-1

Fig 56. Package outline SOT357-1 (TQFP64)

## 17. Handling information

All input and output pins are protected against ElectroStatic Discharge (ESD) under normal handling. When handling Metal-Oxide Semiconductor (MOS) devices ensure that all normal precautions are taken as described in *JESD625-A*, *IEC 61340-5* or equivalent standards.

## 18. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

### 18.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

### 18.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

### 18.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

### 18.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 57](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 41](#) and [42](#)

**Table 41. SnPb eutectic process (from J-STD-020D)**

Package thickness (mm)	Package reflow temperature (°C)	
	Volume (mm <sup>3</sup> )	
	< 350	≥ 350
< 2.5	235	220
≥ 2.5	220	220

**Table 42. Lead-free process (from J-STD-020D)**

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm <sup>3</sup> )		
	< 350	350 to 2000	> 2000
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 57](#).

For further information on temperature profiles, refer to Application Note AN10365 “Surface mount reflow soldering description”.

## 20. Abbreviations

**Table 44. Abbreviations**

Acronym	Description
AEC	Automotive Electronics Council
CMOS	Complementary Metal Oxide Semiconductor
DC	Direct Current
EPROM	Erasable Programmable Read-Only Memory
HBM	Human Body Model
I <sup>2</sup> C	Inter-Integrated Circuit bus
IC	Integrated Circuit
LCD	Liquid Crystal Display
LSB	Least Significant Bit
MSB	Most Significant Bit
MSL	Moisture Sensitivity Level
MUX	Multiplexer
OTP	One Time Programmable
PCB	Printed-Circuit Board
POR	Power-On Reset
RC	Resistance-Capacitance
RAM	Random Access Memory
RMS	Root Mean Square
SCL	Serial Clock Line
SDA	Serial DATA line
SMD	Surface Mount Device
SPI	Serial Peripheral Interface

## 23. Legal information

### 23.1 Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 23.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 23.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use in automotive applications** — This NXP Semiconductors product has been qualified for use in automotive applications. Unless otherwise agreed in writing, the product is not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

## Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
