

ISL9237EVAL2Z

Evaluation Board User Guide

UG075

Rev 3.00

November 4, 2016

Description

The [ISL9237](#) is a buck-boost Narrow Output Voltage DC (NVDC) charger utilizing Intersil's advanced R3™ Technology to provide high light-load efficiency, fast transient response, and seamless DCM/CCM transitions for a variety of mobile and industrial applications.

In Charge mode, the ISL9237 takes input power from a wide range (4V to 20V) of DC power sources (conventional AC/DC charger adapters, USB PD ports, travel adapters, etc.) and safely charges battery packs with up to three cells in a series configuration.

The ISL9237 supports On-the-Go (OTG) function for 2- and 3-cell battery applications. When OTG function is enabled, the ISL9237 operates in Reverse Buck mode to provide 5V at the USB port.

The ISL9237 has serial communication via SMBus/I²C that allows programming of many critical parameters to deliver a customized solution. These programming parameters include, but are not limited to: adapter current limit, charger current limit, system voltage setting, and trickle-charging current limit.

The ISL9237EVAL2Z evaluation board is designed to demonstrate the performance of the ISL9237. The default value numbers of the battery in series, the switching frequency, and the adapter current limit charging function can be programmed by the resistor from the PROG pin to GND. Those values also can be set by SMBus.

Related Literature

- For a full list of related documents please visit our website
- [ISL9237](#) product page

Key Features

- Buck-boost NVDC charger for 1-, 2-, 3-cell Li-ion batteries
- End of Charge (EOC) option
- System power monitor PSYS output, IMVP-8 compliant
- PROCHOT# open-drain output, IMVP-8 compliant
- Allows trickle charging of depleted battery
- Optional ASGATE FET control
- Ideal diode control in Turbo mode
- Reverse buck, boost, and buck-boost operation from battery
- Two-level adapter current limit available
- Battery Ship mode option
- SMBus and auto-increment I²C compatible

Specifications

- V_{IN} = 3.8V to 24V (no dead zone)
- V_{OUT} = 2.5V to 12.6V
- MAX I_{charge} up to 6A
- f_{SW} = 1MHz maximum

Ordering Information

PART NUMBER	DESCRIPTION
ISL9237EVAL2Z	ISL9237 buck-boost charger evaluation board

FIGURE 1. BLOCK DIAGRAM

Recommended Equipment

- 0V to 25V power supply with at least 6A source current capability
- Electronic load capable of sinking current up to 6A
- Battery emulator capable of sinking and sourcing current up to 6A
- Digital Multimeters (DMMs)
- 100MHz quad-trace oscilloscope

NOTE: Customers can use a power supply (which can source but cannot sink current) in parallel with an e-load Constant Current (CC) mode to emulate the battery. For example, for charging, set the charging current command lower than the CC mode e-load. If the e-load CC mode current is set at 3A, the charge current command is 2A, then the e-load will take 2A from the charger and take another 1A from the power supply in parallel with it. For discharging, the power supply is just like the battery to discharge current. The user can also use the e-load Constant Voltage (CV) mode to emulate the battery to take the charging current from the charger and set the e-load CV voltage below the MaxSysV register setting, however, this e-load CV mode cannot source current like a battery.

Software Requirement

The ISL9237 evaluation board needs to be used with the required software. The ISL9237 evaluation kit software can be found on our [website](#).

ISL9237 evaluation kit software consists of the ISL9237 evaluation software, SMBus USB driver README file, and the software installation guide.

Functional Description

The ISL9237EVAL2Z provides all circuits that are required to evaluate the features of the ISL9237. A majority of the features of the ISL9237, such as adjustable output voltage, On-the-Go (OTG) mode, Trickle Charging mode for depleted battery, and system power monitor at buck, Boost and Buck-Boost modes are available on this evaluation board.

Quick Start Guide

The number of battery cell and adapter current limit default values can be configured with a standard 1% 0603 resistor (R_{23}) from the PROG pin to GND. The "PROG PIN PROGRAMMING OPTIONS" table in the [ISL9237](#) datasheet shows the

programming options. After the default number of cells in series are set, the default values for MaxSystemVoltage and MinSystemVoltage are set accordingly. These values can also be changed through the SMBus control registers, which are implemented with the Intersil GUI, shown in [Figure 2 on page 3](#).

Three LEDs are indicating ACOK, PROCHOT, and OTGPG/CMOUT status, respectively. For more details about the functions of these three pins, refer to the [ISL9237](#) datasheet. Follow these steps to evaluate the ISL9237 key functions, including system voltage regulation, input current limit regulation, Charging mode, Trickle Charging mode, and OTG mode. [Figure 3](#), which is the top view of the evaluation board, highlights the key testing points and connection terminals. For other modes or more information about ISL9237, please refer to the [ISL9237](#) datasheet.

System Voltage Regulation

1. Set the power supply to 5V and, with the output disabled, connect the (+) to J1 and the (-) end to J2.
2. Ensure jumpers JP3, JP4, and JP6 are shorted. SW1 and SW2 should switch to the low position.
3. Turn on the power supply, measure VSYS using the DMM across (+) and (-) TP5. VSYS should read 8.38V. The current meter on the supply should read <100mA. Increase V_{IN} from 5V to 15V slowly. Monitor PH1 and PH2 to observe seamless switching from Boost mode to Buck-Boost mode and finally into Buck mode.

Input Current Limit Regulation

1. Keep V_{IN} as a constant value between 3.8V and 24V. Set the battery emulator voltage to 7.8V, connect the battery emulator output to battery leads, J5 and J6. Then, turn on the battery emulator; there is no charge and discharge current for the battery, which is consistent to the BGATE signal of a high voltage level.
2. Add an electrical load on VSYS and GND terminals, J3 and J4. Turn on the load and increase the electrical load slowly; the input current increases correspondingly and VSYS keeps stable at 8.38V. The output voltage (VSYS) will start dropping as the input current reaches the 1.5A input current limit. For the input current limit details, refer to the [ISL9237](#) datasheet. If the VSYS voltage is 150mV lower than the battery voltage, BGATE FET will turn on at a low voltage level, such that the battery supplies the current to the load.

FIGURE 2. GUI SNAPSHOT

FIGURE 3. EVALUATION BOARD CONNECTION GUIDELINE

Charging Mode

1. Set the power supply to a constant value between 3.8V and 24V, then do Steps 1 and 2 in [“System Voltage Regulation” on page 2](#). Make sure the input current does not hit the limit.
2. Set the battery emulator voltage to 7.8V; connect the battery emulator output to battery leads, J5 and J6.
3. Connect the USB cable at USB port for the SMBus; LED 1, 2, and 3 are all lighting.
4. Turn on the power supply; LED 3 goes out. Then turn on the battery emulator and open Intersil ISL9237 GUI ([Figure 2 on page 3](#)). Note: The USB interface with a green tick means the GUI is ready to communicate with the evaluation board. If the USB interface shows a red cross, the GUI is not ready to communicate with the evaluation board. Click the “reset USB” button until a green tick shows in the USB interface. If not green, check the USB connection.
5. Select “2 Cell” and click the “Write All” button, all controller register values are set to the default values correspondingly. The system voltage is 8.4V, which is the value of MaxSystemVoltage in the GUI. There is no charge and discharge current for battery. Change the “ChargeCurrentLimit” from 0A to 2A then click the “Write” button. The battery is now in a 2A current charge operation. The charge current value can be monitored in the GUI by clicking the “Read” button in the ChargeCurrentLimit column. Monitor the BGATE signal status to confirm battery is in Charging mode.

Note: Make sure the input current does not reach the input current limit value, especially for a small V_{IN} input.

Trickle Charging Mode

1. Do steps 1 through 5 in [“Charging Mode”](#) without any changes.
2. Decrease the battery emulator voltage and monitor the battery charging current. As long as the battery emulator voltage is less than 5.2V (lower than SystemMinVoltage), the battery enters trickle Charging mode and the charge current decreases to 0.26A. The trickle-charge current value can be changed through the SMBus control registers, refer to the [ISL9237](#) datasheet.

Note: Make sure the input current does not reach the input current limit value, especially for small V_{IN} input.

OTG Mode

1. Set the battery emulator voltage at a constant value between 5.8V and 15V; connect the battery leads, J5 and J6, with the output disabled.
2. Connect electric load on supply leads, J1 and J2, with the output disabled.
3. Connect the USB cable at the USB port for SMBus; only LED 1 light is on. Turn on the battery emulator and electrical load without adding any load.
4. Open the Intersil ISL9237 GUI, The OTGVoltage is the voltage value for load side, as shown in [Figure 4 on page 5](#), and the OTGCurrent is the OTG output current limit at load side. These values can be set as needed by the customer, within the output limit range. For their value range, please refer to the [ISL9237](#) datasheet.
5. Select the “Control1&2 registers” tab, enable the OTG function at Control1 register, then click the “Write” button, as shown in [Figure 5 on page 5](#).
6. Switch SW2 on the evaluation board to the HI position; the load voltage is regulated as an OTGVoltage value, set in [Figure 5](#), and the LED 3 light is on, which means the OTG function is enabled.
7. Increase the electrical load slowly and monitor the load voltage. As long as the load current is less than the OTGCurrent limit value, the load voltage will be regulated at the setting value.

FIGURE 4. OTG VOLTAGE AND CURRENT SETTING IN GUI

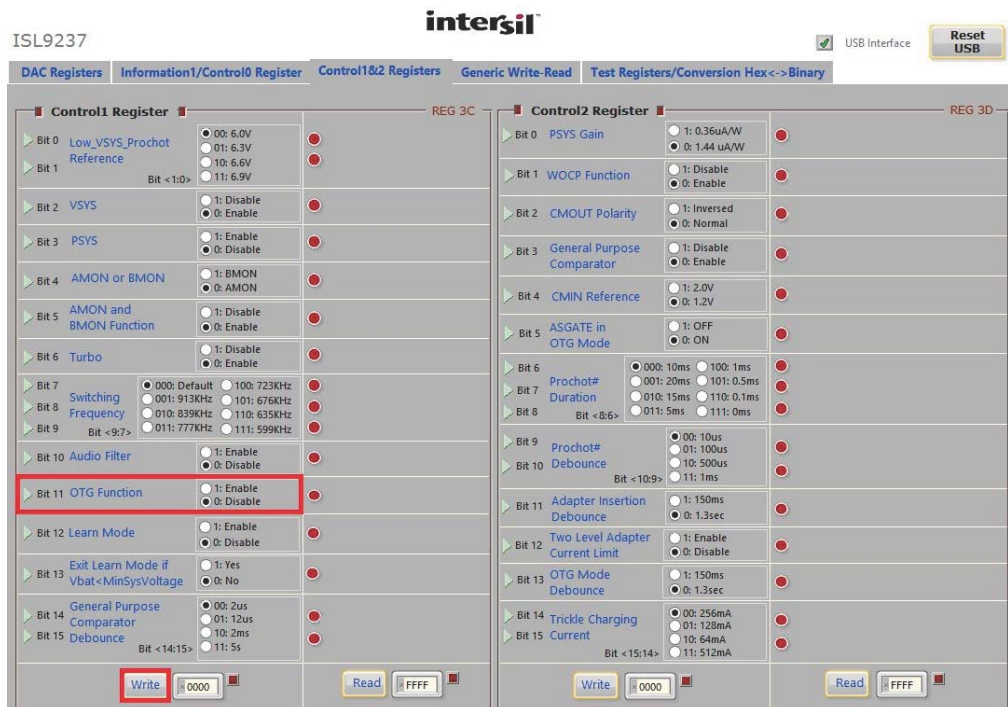

FIGURE 5. OTG FUNCTION ENABLE

ISL9237EVAL2Z Schematic

All NFETs and PFETs are 3x3 size

SDA, SCL, ACOK, PROCHOT#, BATGONE, OTGPG/CMOUT, OTGEN all have 3V3 or VDD pull up options

PCB Layout Guidelines

PIN NUMBER	PIN NAME	LAYOUT GUIDELINES
BOTTOM PAD 33	GND	Connect this ground pad to the ground plane through low impedance path. Recommend use of at least five vias to connect to ground planes in PCB to ensure there is sufficient thermal dissipation directly under the IC.
1	CSON	<p>Run two dedicated traces with decent width in parallel (close to each other to minimize the loop area) from the two terminals of the battery current-sensing resistor to the IC. Place the differential mode and common-mode RC filter components in general proximity of the controller.</p> <p>Route the current-sensing traces through vias to connect the center of the pads; or route the traces into the pads from the inside of the current-sensing resistor. The following drawings show the two preferred ways of routing current-sensing traces.</p> 
2	CSOP	
3	VSYS	Signal pin. Provides feedback for the system bus voltage. Place the optional RC filter in general proximity of the controller. Run a dedicated trace from system bus to the pin and do not route near the switching traces. Do not share the same trace with the signal routing to the DCIN pin OR diodes.
4	BOOT2	Switching pin. Place the bootstrap capacitor in general proximity of the controller. Use decent wide trace. Avoid any sensitive analog signal trace from crossing over or getting close.
5	UGATE2	Run these two traces in parallel fashion with decent width. Avoid any sensitive analog signal trace from crossing over or getting close. Recommend routing PHASE2 trace to high-side MOSFET source pin instead of general copper.
6	PHASE2	<p>The IC should be placed close to the switching MOSFET's gate terminals and keep the gate drive signal traces short for a clean MOSFET drive. The IC can be placed on the opposite side of the switching MOSFETs.</p> <p>Place the output capacitors as close as possible to the switching high-side MOSFET drain and the low-side MOSFET source; and use shortest PCB trace connection. Place these capacitors on the same PCB layer with the MOSFETs instead of on different layers and using vias to make the connection.</p> <p>Place the inductor terminal to the switching high-side MOSFET drain and low-side MOSFET source terminal as close as possible. Minimize this phase node area to lower the electrical and magnetic field radiation but make this phase node area big enough to carry the current. Place the inductor and the switching MOSFETs on the same layer of the PCB.</p>
7	LGATE2	Switching pin. Run LGATE2 trace in parallel with UGATE2 and PHASE2 traces on the same PCB layer. Use decent width. Avoid any sensitive analog signal trace from crossing over or getting close.
8	VDDP	Place the decoupling capacitor in general proximity of the controller. Run the trace connecting to VDD pin with decent width.
9	LGATE1	Switching pin. Run LGATE1 trace in parallel with UGATE1 and PHASE1 traces on the same PCB layer. Use decent width. Avoid any sensitive analog signal trace from crossing over or getting close.

PCB Layout Guidelines (Continued)

PIN NUMBER	PIN NAME	LAYOUT GUIDELINES
10	PHASE1	Run these two traces in parallel fashion with decent width. Avoid any sensitive analog signal trace from crossing over or getting close. Recommend routing PHASE1 trace to high-side MOSFET source pin instead of general copper.
11	UGATE1	<p>The IC should be placed close to the switching MOSFET's gate terminals and keep the gate drive signal traces short for a clean MOSFET drive. The IC can be placed on the opposite side of the switching MOSFETs.</p> <p>Place the input capacitors as close as possible to the switching high-side MOSFET drain and the low-side MOSFET source, and use shortest PCB trace connection. Place these capacitors on the same PCB layer with the MOSFETs instead of on different layers and using vias to make the connection.</p> <p>Place the inductor terminal to the switching high-side MOSFET drain and low-side MOSFET source terminal as close as possible. Minimize this phase node area to lower the electrical and magnetic field radiation but make this phase node area big enough to carry the current. Place the inductor and the switching MOSFETs on the same layer of the PCB.</p>
12	BOOT1	Switching pin. Place the bootstrap capacitor in general proximity of the controller. Use decent wide trace. Avoid any sensitive analog signal trace from crossing over or getting close.
13	ASGATE	Run this trace with decent width in parallel fashion with the ADP pin trace.
14	CSIN	Run two dedicated traces with decent width in parallel (close to each other to minimize the loop area) from the two terminals of the adapter current-sensing resistor to the IC. Place the differential mode and common mode RC filter components in general proximity of the controller.
15	CSIP	<p>Route the current-sensing traces through vias to connect the center of the pads, or route the traces into the pads from the inside of the current-sensing resistor. The following drawings show the two preferred ways of routing current-sensing traces.</p> 
16	ADP	Run this trace with decent width in parallel fashion with the ASGATE pin trace.
17	DCIN	Place the OR diodes and the RC filter in general proximity of the controller. Run the VADP trace and VSYS trace to the OR diodes with decent width.
18	VDD	Place the RC filter connecting with VDDP pin in general proximity of the controller. Run the trace connecting to VDDP pin with decent width.
19	ACIN	Place the voltage divider resistors and the optional decoupling capacitor in general proximity of the controller.
20	OTGEN/CMIN	No special consideration.
21	SDA	Digital pins. No special consideration. Run SDA and SCL traces in parallel.
22	SCL	
23	PROCHOT#	Digital pin, open-drain output. No special consideration.
24	ACOK	
25	BATGONE	Digital pin. Place the 100kΩ resistor series in the BATGONE signal trace and the optional decoupling capacitor in general proximity of the controller.
26	OTGPG/CMOUT	Digital pin, open-drain output. No special consideration.
27	PROG	Signal pin. Place the PROG programming resistor in general proximity of the controller.
28	COMP	Place the compensation components in general proximity of the controller. Avoid any switching signal from crossing over or getting close.
29	AMON/BMON	No special consideration. Place the optional RC filter in general proximity of the controller.
30	PSYS	Signal pin, current source output. No special consideration.

PCB Layout Guidelines (Continued)

PIN NUMBER	PIN NAME	LAYOUT GUIDELINES
31	VBAT	Place the optional RC filter in general proximity of the controller. Run a dedicated trace from the battery positive connection point to the IC.
32	BGATE	Use decent width trace from the IC to the BGATE MOSFET gate. Place the capacitor from BGATE to ground close to the MOSFET.

FIGURE 22. OTG MODE 0.5A TO 2A TRANSIENT LOAD, OTG VOLTAGE = 5.12V

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

(Rev.4.0-1 November 2017)

Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
