

# COMLINEAR<sup>®</sup> CLC1011, CLC2011, CLC4011

## Low Power, Low Cost, Rail-to-Rail I/O Amplifiers

### FEATURES

- 136 $\mu$ A supply current
- 4.9MHz bandwidth
- Output swings to within 20mV of either rail
- Input voltage range exceeds the rail by >250mV
- 5.3V/ $\mu$ s slew rate
- 21nV/ $\sqrt{\text{Hz}}$  input voltage noise
- 16mA output current
- Fully specified at 2.7V and 5V supplies
- CLC1011: Pb-free SOT23-5, SC70-5, SOIC-8
- CLC2011: Pb-free SOIC-8, MSOP-8
- CLC4011: Pb-free SOIC-14, TSSOP-14

### APPLICATIONS

- Portable/battery-powered applications
- PCMCIA, USB
- Mobile communications, cell phones, pagers
- ADC buffer
- Active filters
- Portable test instruments
- Notebooks and PDA's
- Signal conditioning
- Medical Equipment
- Portable medical instrumentation

### General Description

The COMLINEAR CLC1011 (single), CLC2011 (dual), and CLC4011 (quad) are ultra-low cost, low power, voltage feedback amplifiers. At 2.7V, the CLCx011 family uses only 136 $\mu$ A of supply current per amplifier and are designed to operate from a supply range of 2.5V to 5.5V ( $\pm 1.25$  to  $\pm 2.75$ ). The input voltage range exceeds the negative and positive rails.

The CLCx011 family of amplifiers offer high bipolar performance at a low CMOS prices. They offer superior dynamic performance with 4.9MHz small signal bandwidths and 5.3V/ $\mu$ s slew rates. The combination of low power, high bandwidth, and rail-to-rail performance make the CLCx011 amplifiers well suited for battery-powered communication/computing systems.

### Typical Performance Examples

Large Signal Frequency Response

Output Swing vs. Load

### Ordering Information

Part Number	Package	Pb-Free	RoHS Compliant	Operating Temperature Range	Packaging Method
CLC1011ISC5X*	SC70-5	Yes	Yes	-40°C to +85°C	Reel
CLC1011IST5X*	SOT23-5	Yes	Yes	-40°C to +85°C	Reel
CLC2011ISO8X	SOIC-8	Yes	Yes	-40°C to +85°C	Reel
CLC2011IMP8X*	MSOP-8	Yes	Yes	-40°C to +85°C	Reel
CLC4011ISO14X*	SOIC-14	Yes	Yes	-40°C to +85°C	Reel
CLC4011ITP14X*	TSSOP-14	Yes	Yes	-40°C to +85°C	Reel

Moisture sensitivity level for all parts is MSL-1. \*Advance Information - Future Products.

14	OUT4	Output, channel 4

## Absolute Maximum Ratings

The safety of the device is not guaranteed when it is operated above the "Absolute Maximum Ratings". The device should not be operated at these "absolute" limits. Adhere to the "Recommended Operating Conditions" for proper device function. The information contained in the Electrical Characteristics tables and Typical Performance plots reflect the operating conditions noted on the tables and plots.

Parameter	Min	Max	Unit
Supply Voltage	0	6	V
Input Voltage Range	$-V_S - 0.5V$	$+V_S + 0.5V$	V
Continuous Output Current	-40	40	mA

## Reliability Information

Parameter	Min	Typ	Max	Unit
Junction Temperature			175	°C
Storage Temperature Range	-65		150	°C
Lead Temperature (Soldering, 10s)			260	°C

## Application Information

### General Description

The CLCx011 family of amplifiers are single supply, general purpose, voltage-feedback amplifiers. They are fabricated on a complimentary bipolar process, feature a rail-to-rail input and output, and are unity gain stable.

### Basic Operation

Figures 1, 2, and 3 illustrate typical circuit configurations for non-inverting, inverting, and unity gain topologies for dual supply applications. They show the recommended bypass capacitor values and overall closed loop gain equations. Figure 4 shows the typical non-inverting gain circuit for single supply applications.

Figure 1. Typical Non-Inverting Gain Circuit

Figure 2. Typical Inverting Gain Circuit

Figure 3. Unity Gain Circuit

Figure 4. Single Supply Non-Inverting Gain Circuit

### Power Dissipation

Power dissipation should not be a factor when operating under the stated 10k ohm load condition. However, applications with low impedance, DC coupled loads should be analyzed to ensure that maximum allowed junction temperature is not exceeded. Guidelines listed below can be used to verify that the particular application will not cause the device to operate beyond its intended operating range.

Maximum power levels are set by the absolute maximum junction rating of 150°C. To calculate the junction temperature, the package thermal resistance value  $\Theta_{JA}$  ( $\Theta_{JA}$ ) is used along with the total die power dissipation.

$$T_{\text{Junction}} = T_{\text{Ambient}} + (\Theta_{JA} \times P_D)$$

Where  $T_{\text{Ambient}}$  is the temperature of the working environment.

In order to determine  $P_D$ , the power dissipated in the load needs to be subtracted from the total power delivered by the supplies.

$$P_D = P_{\text{supply}} - P_{\text{load}}$$

Supply power is calculated by the standard power equation.

$$P_{\text{supply}} = V_{\text{supply}} \times I_{\text{RMS supply}}$$

$$V_{\text{supply}} = V_{S+} - V_{S-}$$

Power delivered to a purely resistive load is:

$$P_{\text{load}} = ((V_{\text{LOAD}})_{\text{RMS}}^2) / R_{\text{load eff}}$$

The effective load resistor ( $R_{\text{load eff}}$ ) will need to include the effect of the feedback network. For instance,

$R_{\text{load eff}}$  in figure 3 would be calculated as:

$$R_L \parallel (R_f + R_g)$$

These measurements are basic and are relatively easy to perform with standard lab equipment. For design purposes however, prior knowledge of actual signal levels and load impedance is needed to determine the dissipated power. Here,  $P_D$  can be found from

$$P_D = P_{\text{Quiescent}} + P_{\text{Dynamic}} - P_{\text{Load}}$$

Quiescent power can be derived from the specified  $I_S$  values along with known supply voltage,  $V_{\text{Supply}}$ . Load power can be calculated as above with the desired signal amplitudes using:

$$(V_{\text{LOAD}})_{\text{RMS}} = V_{\text{PEAK}} / \sqrt{2}$$

$$(I_{\text{LOAD}})_{\text{RMS}} = (V_{\text{LOAD}})_{\text{RMS}} / R_{\text{load eff}}$$

The dynamic power is focused primarily within the output stage driving the load. This value can be calculated as:

$$P_{\text{DYNAMIC}} = (V_{S+} - V_{\text{LOAD}})_{\text{RMS}} \times (I_{\text{LOAD}})_{\text{RMS}}$$

Assuming the load is referenced in the middle of the power rails or  $V_{\text{supply}}/2$ .

Figure 4 shows the maximum safe power dissipation in the package vs. the ambient temperature for the packages available.

Figure 4. Maximum Power Derating

### Input Common Mode Voltage

The common mode input range extends to 250mV below ground and to 250mV above  $V_s$ , in single supply operation. Exceeding these values will not cause phase reversal. However, if the input voltage exceeds the rails by more than 0.5V, the input ESD devices will begin to conduct. The output will stay at the rail during this overdrive condition. If the absolute maximum input voltage (700mV beyond either rail) is exceeded, externally limit the input current to  $\pm 5\text{mA}$  as shown in Figure 5.

Figure 5. Circuit for Input Current Protection

### Driving Capacitive Loads

Increased phase delay at the output due to capacitive loading can cause ringing, peaking in the frequency response, and possible unstable behavior. Use a series resistance,  $R_S$ , between the amplifier and the load to help improve stability and settling performance. Refer to Figure 6.

Figure 6. Addition of  $R_S$  for Driving Capacitive Loads

Table 1 provides the recommended  $R_S$  for various capacitive loads. The recommended  $R_S$  values result in approximately <1dB peaking in the frequency response. The Frequency Response vs.  $C_L$  plot, on page 6, illustrates the response of the CLCx011.

$C_L$ (pF)	$R_S$ ( $\Omega$ )	-3dB BW (kHz)
10pF	0	2.2
20pF	0	2.4
50pF	0	2.5
100pF	100	2

Table 1: Recommended  $R_S$  vs.  $C_L$

For a given load capacitance, adjust  $R_S$  to optimize the tradeoff between settling time and bandwidth. In general, reducing  $R_S$  will increase bandwidth at the expense of additional overshoot and ringing.

**Overdrive Recovery**

An overdrive condition is defined as the point when either one of the inputs or the output exceed their specified voltage range. Overdrive recovery is the time needed for the amplifier to return to its normal or linear operating point. The recovery time varies, based on whether the input or output is overdriven and by how much the range is exceeded. The CLCx011 will typically recover in less than 50ns from an overdrive condition. Figure 7 shows the CLC1011 in an overdriven condition.

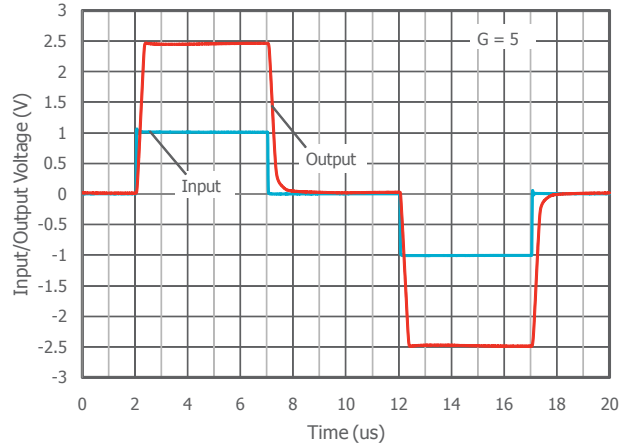

Figure 7. Overdrive Recovery

**Layout Considerations**

General layout and supply bypassing play major roles in high frequency performance. CADEKA has evaluation boards to use as a guide for high frequency layout and as an aid in device testing and characterization. Follow the steps below as a basis for high frequency layout:

- Include 6.8 $\mu$ F and 0.1 $\mu$ F ceramic capacitors for power supply decoupling
- Place the 6.8 $\mu$ F capacitor within 0.75 inches of the power pin
- Place the 0.1 $\mu$ F capacitor within 0.1 inches of the power pin
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance
- Minimize all trace lengths to reduce series inductances

Refer to the evaluation board layouts below for more information.

**Evaluation Board Information**

The following evaluation boards are available to aid in the testing and layout of these devices:

Evaluation Board	Products
CEB011	CLC1011 in SC70
CEB002	CLC1011 in SOT23
CEB006	CLC2011 in SOIC
CEB010	CLC2011 in MSOP
CEB018	CLC4011 in SOIC
CEB017	CLC4011 in TSSOP

### Evaluation Board Schematics

Evaluation board schematics and layouts are shown in Figures 8-14. These evaluation boards are built for dual-supply operation. Follow these steps to use the board in a single-supply application:

1. Short  $-V_S$  to ground.
2. Use C3 and C4, if the  $-V_S$  pin of the amplifier is not directly connected to the ground plane.

## Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
